Former Philadelphia Refinery
Public Comment Remedial Investigation Report
March 31, 2021

TABLE OF CONTENTS

APPENDICES

COMMON ACRONYMS IN ACT 2 REPORTS

AOI	Area of Interest
CO&A	Consent Order and Agreement
COC	Constituent (or Compound) of Concern
EPA	United States Department of Environmental Protection
LNAPL	Light Non-Aqueous Phase Liquid
NIR	Notice of Intent to Remediate
MSC	Medium Specific Concentration
MTBE	Methyl Tertiary-Butyl Ether
PADEP	Pennsylvania Department of Environmental Protection
PES	Philadelphia Energy Solutions
PRM	Potomac-Raritan-Magothy
PWD	Philadelphia Water Department
RIR	Remedial Investigation Report
VOC	Volatile Organic Compound

1.0 INTRODUCTION

This Public Comment Remedial Investigation Report (RIR) addresses public comments that have been submitted for the former Philadelphia Refinery (Site) in relation to past reports completed under Pennsylvania's Land Recycling and Environmental Remediation Standards Act (Act 2) Program, as well as the joint Pennsylvania Department of Environmental Protection (PADEP) and U.S. Environmental Protection Agency (EPA) One Cleanup Program. Since Dec. 30, 2013, Philadelphia Refinery Operations, a series of Evergreen Resources Group, LLC (Evergreen), has managed the investigation and remediation of the legacy environmental conditions at the Site. Evergreen is an affiliate of Sunoco, Inc., now known as ETC Sunoco Holdings LLC.

Evergreen submitted a Notice of Intent to Remediate (NIR) to the PADEP in 2006, formally entering the Site into the Act 2 Program. At the request of the City of Philadelphia (City), Evergreen developed a Public Involvement Plan (PIP) in 2006 and updated it in 2019. The PADEP requested that Evergreen prepare this Public Comment RIR to complete the public involvement process for the past Act 2 Reports that were previously submitted to the PADEP. Each report had a 30-day comment period at the time of their submittal and the City requested an additional 120-day comment period to allow the public time to review the past reports and provide their comments and questions.

A Public Information Session was scheduled for Nov. 7, 2019 to start the comment period and provide a summary of the data contained within the reports but was unfortunately blocked by a community group from being completed as planned. Evergreen, however, has willingly included all comments received during and since the November 2019 attempted meeting in this Public Comment RIR. Evergreen successfully held a Public Information Session on Aug. 27, 2021, which officially opened the "120-day" comment period. Evergreen held another Public Information Session on Jan. 14, 2021, which marked the end of the "120-day" comment period. Even though 120 days from the Aug. 27, 2020 public information session was Dec. 26, 2020, Evergreen included comments received through the Public Information Session on Jan. 14, 2021 in this report. While the purpose of the public comment period was to engage the public in reviewing and providing comment on reports previously reviewed by the regulatory agencies, many comments collected to date do not relate specifically to the past reports, but rather to other topics that may be addressed in future Act 2 submittals. However, all comments received through Jan. 14, 2021, are addressed in this Public Comment RIR, regardless of topic and method of submittal (e.g. written, live during public meetings, telephone, or other methods).

Evergreen consulted other stakeholders for some of the answers provided in this document, as they either fully or partially pertained to other entities' activities or were better-suited to be answered by a regulatory agency. These other stakeholders include the PADEP, EPA, the City, and Hilco Redevelopment Partners (HRP or Hilco). An EPA contractor, Skeo Solutions, Inc. (Skeo), held a public meeting on Aug. 6, 2020, where they presented the results of their review of the past Act 2 reports. This Public Comment RIR also includes comments that were made during Skeo's public meeting if they were not already addressed by comments made directly to Evergreen.

For ease of review, questions with similar subject matter and responses are grouped together below. In addition, as the purpose of the public comment period was for review of past Act 2 reports, comments associated with those reports are included in a separate section from comments and questions related to other topics. Appendix A includes copies of the public notices that were sent out for this report. Appendices B and C include copies of the comments received from the public. Some comments were duplicated by multiple commentors; in these instances, the question is only included once in the text of

this report, but all original comments are included as submitted in Appendices B and C. The comments and responses included in the text of this report are also included on Evergreen's website for the Site (https://phillyrefinerycleanup.info).

2.0 COMMENTS AND RESPONSES RELATED TO PAST ACT 2 REPORTS

Section 2.0 summarizes the comments from the public related to the past Act 2 reports and provides Evergreen's and/or others' responses.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
Air monitoring has been done on site to see if vapors were present in refinery buildings or the surrounding air. When will this investigation of air quality be extended to surrounding areas, slash neighborhoods?

Question:
Most of the testing in all media was limited to the industrial site or very close to it. Since contamination from air pollution occurred continuously outside the site, since most contamination migrates and may change over time, depending on many factors, more extensive offsite testing for all compounds should be done.

Question:
Evergreen conducted air monitoring for indoor air in buildings on the site, will you also monitor the basement of homes near the VOC contamination for ambient pollution?

Answer:
As part of the Act 2 program, Evergreen evaluates potential air quality effects from subsurface conditions (as opposed to any air quality issues from above-ground operations). The evaluation of any vapors to indoor and outdoor air from a dissolved plume beneath the subsurface is part of the evaluation required by Act 2 and will be included in future Act 2 reports, submitted upon completion of all Remedial Investigation Reports. Evergreen has conducted initial assessments using existing data and conservative assumptions, which did not find any potential impacts to off-site residences from the conditions in shallow groundwater; therefore, we have no plans to test off-site buildings. However, future fate and transport evaluation will model the projected extent of groundwater contaminants, which will be used to confirm the assessment of offsite air quality effects from subsurface conditions and will be summarized future reports.

Question:
When were the outdoor air samples taken?

Answer:
The outdoor (ambient) air samples that Evergreen has collected across the Site have been collected over many years. Some samples were collected during individual Area of Interest (AOI) investigations, and some were collected as part of a site-wide vapor investigation, generally conducted between 2009 and 2018. Individual sample dates are included in the air data tables within the RIRs.

Question:
It seems like many of the RIRs are still pending despite Hilco's plans to start construction in 2021. 1) What AOIs are planned to be clear to build in 2021 and 2) what are the states of their RIR and Remedial Action Reports such that building can occur so soon. 3) If [Hilco is] starting in the North, AOI 8 has an identified benzene plume that exceeds the site boundary to the north. There is a sample point in the lower aquifer on the boundary that is outside of the active and inactive remediation boundaries. What are the remediation activities that need to be done prior to construction to address these needs?

Answer:
Hilco Redevelopment Partners' construction schedule is not dependent on completion of Evergreen's remediation activities. Operation of Evergreen's remediation systems in the North Yard (AOI 8) and in other areas of the Site will continue during and after Hilco Redevelopment Partners' decommissioning, demolition, and redevelopment activities. Hilco Redevelopment Partners and Evergreen have and will continue to coordinate actively to make sure Evergreen's work can continue during Hilco Redevelopment Partners redevelopment.

With respect to soil delineation, Remedial Investigation (RI) activities are complete in all AOIs. With respect to groundwater, Evergreen is collecting additional off-site information for AOI 4 and AOI 9, and RI activities are complete for the other AOIs. After all RI activities are complete, Evergreen will submit Cleanup Plans that will incorporate Hilco Redevelopment Partners planned development.

The question was also provided to Hilco Redevelopment Partners, who provided the following response: Hilco Redevelopment Partners recognizes the potential for impacted soil and groundwater to act as vapor-intrusion sources for new buildings constructed at the Site. Hilco Redevelopment Partners will conduct sampling and analysis to evaluate the potential for vapor intrusion into planned buildings in accordance with PADEP guidance. If warranted based on sampling results, Hilco Redevelopment Partners will install vapor barriers or other vapor-mitigation controls (such as subslab venting systems) beneath new buildings.

Question:
When will Evergreen conduct the fate and transport analysis for the lower aquifer? There is no aquitard between upper and lower aquifer across most of the site. Won't the heavily contaminated shallow aquifer gradually leach contaminants into the lower aquifer? (a critical drinking water source for New Jersey)

Answer:
The fate and transport analysis for the lower aquifer will be performed once the RIRs for AOIs 4 and 9 have been approved. Areas beneath the Site where connections exist between the lower aquifer and water table aquifer are less extensive than the areas where we have that important clay layer present. The cross section shown during the August 27, 2020 Public Information Session was just one example from the site model that straddles the Schuylkill River where the aquitard is interpreted to be missing. Other cross sections show the continuity of that clay layer. Even where the aquitard is missing, it does not necessarily mean that water and contaminants will move down into the deeper aquifer. That potential has to do with pressure gradients that the model can simulate. The fate and transport model will simulate future scenarios based upon current conditions.

It is noted that the fate and transport analysis will include mapping of the middle clay unit aquitard. Water quality in the lower aquifer is monitored through routine sampling of groundwater from approximately 80 wells, and to date, we have not observed significant contamination in the lower aquifer beneath the Site. Considering the aging and degrading petroleum sources in the water table from historic Sunoco sources, we do not expect groundwater hydrocarbon plumes to expand under current groundwater conditions.

Question:
Are drinking water intake portals downstream from the site. All the way to the Delaware Bay?

Answer:
As a part of the investigations, Evergreen conducted a well search including field reconnaissance within a one-mile radius of the Site using Pennsylvania's Groundwater Information System (PaGWIS) and PADEP's eMapPA GIS mapping tool. Search results did not identify potable water supply wells in the area. We also conducted a search of surface water intakes from the Schuylkill River within one mile of the Site, and the Philadelphia Water Department did not identify any surface water intake portals within one mile in its 2010 "Schuylkill River Hydrology and Consumptive Use Report." For reference, the search radius for potable groundwater or surface water is typically ¼ to ½ mile from a Site, but Evergreen completed a one-mile search as part of the RI activities for this Site.

Question:
When will the revised RIRs for AOIs 4, 9 and 11 be submitted?

Answer:
The RIR Addendums for AOIs 4 and 9 will be submitted once the public comment period for the approved RIRs is completed and a summary document is submitted and approved by the PADEP. Evergreen incorporated the investigation of the deep groundwater unit (AOI 11) into the other RIRs since 2013 based on discussions with the PADEP, so we will not submit a separate AOI 11 RIR since it has been more appropriately incorporated into previously submitted RIRs. The 2020 First Amendment to the Consent Order and Agreement stipulates that both the AOI 4 and AOI 9 RIR Addendums must be submitted by September 2021, and the Fate and Transport RIR (which will include the AOI 11 lower aquifer) must be submitted by December 2021.

Question:
Gulf operated a refinery where the Schuylkill Tank Farm is currently located before building the refinery at Girard Point. What contamination is left at the former refinery site? What are the implications for people living or working in Eastwick?

Answer:
The site characterization and history for the Schuylkill River Tank Farm (SRTF), which is also known as AOI 9, can be found in the RIR for AOI 9. Some contaminants are present in soil and groundwater related to the~~se~~ former operations. Light non-aqueous phase liquid (LNAPL), or oil, is also present in limited areas and has been observed in monitoring wells. Evergreen completed additional off-site delineation of the dissolved contaminants since the submittal of the last RIR (2017) and is planning to submit these

results to PADEP in a forthcoming addendum to the AOI 9 RIR (2021). The results of the site characterization demonstrate that the contamination from AOI 9 does not extend to any residential areas. The final remedial approach will be presented in a Cleanup Plan dedicated to the SRTF.

Question:
Can these report summaries identify the metrics and the benchmarks that you think Evergreen is attaining and succeeding and those that have not been reached - the question remains – what the critical path benchmarks for Lead, Benzene, Air Quality etc.

Answer:
The goal of each RIR is to identify and define the source of contamination and particular constituents of concern, define the nature and extent of the contaminants (including fate and transport), characterize the affected media, and determine the appropriate Act 2 standards to be used. PADEP and EPA determine whether these goals and benchmarks have been met through their review of the RIRs upon submittal. For example, the RIRs for AOIs 4 and 9 were not approved due to the need for additional delineation of the extent of groundwater impact beyond a property boundary, as identified in the report summaries.

The RIRs compare the data to the Act 2 statewide health standards (one metric of comparison). Future Risk Assessment Reports and Cleanup Plans will define whether other metrics or benchmarks will be used, such as site-specific standards or cleanup goals that must be met to achieve Act 2 closure. The current critical paths for lead, benzene (or any other compound) and air quality (soil or groundwater also) is to complete the remedial investigations to be able to proceed to these future assessments.

Future report summaries will clearly define the goals of the reports and whether those goals have been met.

Question:
How long does it take to collect soil and groundwater data for an AOI?

Answer:
That depends on a number of factors. Data has been collected at the Site for years for various reasons, whether it was in response to a particular release or general characterization of an area. Most AOI investigations begin with compiling all known past data and historical information such as the particular use of an area, then preparing a work plan for collection of new information. After the work plan activities are completed, often additional data needs to be collected to delineate an area of impact (i.e. to further define the contamination horizontally and vertically). The duration of field data collection depends mostly on the number of borings/wells to be installed and the amount of sampling to be conducted. Tasks such as clearing locations for utilities prior to drilling and developing wells after installation and prior to sampling also takes time. Large-scale sampling efforts such as involved here can typically take months to years.

Question:
Is soil tested to a depth greater than 2 feet deep?

Answer:
Yes, soil is tested at many depths. We showed the soil data results in two different slides: 0-2 feet below the surface greater than 2 feet below the surface because the standard concentrations to which we compare our data are different for surface soil (0-2 feet) and subsurface soil (2-15 feet, or greater).

Question:
Immediate multiple station environmental sensing for air, water and soil is essential to establish a baseline of current and future conditions of the now Hilco owner of the refinery.

Answer:
All historic data collected to date has established a baseline of environmental conditions, as per the requirements of Act 2, and have been documented in RIRs. Ongoing groundwater sampling activities and soil samples collected since the RIRs were submitted, and the thousands of soil samples that are to be collected by Hilco Redevelopment Partners as part of its environmental sampling to support redevelopment continue to document conditions at the former refinery. We will monitor future conditions related to the Act 2 Cleanup based on the requirements of the Cleanup Plans and Post-Remedial Care Plan.

Question:
In its remedial investigation, Evergreen should adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater to the river, and into adjacent residential neighborhoods.

Answer: Remedial investigations are evaluations of current conditions, and current condition measurements inherently include climate effects as they have occurred and are occurring. The future effects of climate change will be evaluated in future modeling efforts. The fate and transport modeling efforts are also part of the remedial investigation process.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
Groundwater needs more attention and testing as well as soil. For one thing, an update is needed to reflect the conditions of both shallow and deep groundwater because of the length of time since the reported sampling, and after years of partial remediation. Contamination in groundwater aquifers does not stay in one place for years! I'm also concerned that the shallow and deep aquifers were presented as being separated by an aquitard, implying that the deeper drinking water aquifer was somehow protected from the high pollution in the more shallow areas. However, the shallow and deep aquifers are not continuously separated, leaving contamination to migrate between them. This is even more concerning since some shallow areas of the aquifer are very close to highly contaminated soil and thus very vulnerable to becoming more contaminated over time. Also, while pumping contamination out of the water has removed a lot of pollution, pumping also alters how quickly and in what direction

groundwater (and contamination) moves, and may have increased the movement of contamination between these unconfined aquifers or how far from the refinery the contamination extends. Because of this, it would be prudent to conduct new tests as well as sampling a larger portion of both aquifers.

Question:
The current work cannot be evaluated until all analysis about the aquifers is completed. Without that information, the public does not have all of the information to evaluate decisions on soil and groundwater sampling.

Question:
Evergreen has not sufficiently delineated the nature and extent of contamination in the deep aquifer and the unconfined aquifer (water table).

Answer:
Evergreen conducts continual groundwater sampling at the Site, not just as part of the RIRs. Sampling is necessary before, during and after remediation is complete; therefore, sampling will continue at this facility for quite some time. The current work under evaluation (what's included in the RIRs) includes defining the nature and extent of contamination in the subsurface as well as significant information on the geology and hydrogeology, which do not require additional aquifer analysis to review. Remaining aquifer analysis, which is the fate and transport model, takes the RIR data and predicts migration. The eventual Final Report for the site will also include additional analysis to demonstrate that remediation goals have been attained, which will include further groundwater analysis of aquifer conditions.

We frequently evaluate the direction and rates of groundwater flow at the Site and routinely collect groundwater samples from various hydrogeologic units beneath the Site. Our remedial investigation activities also evaluated the areas where the confining layers in the subsurface were not continuous through the completion of soil borings, installation of monitoring wells, collection of groundwater samples, groundwater elevations and completion of aquifer tests to determine hydraulic properties of the groundwater units. We will use this data for the upcoming evaluation of contaminant movement in the fate and transport evaluation through the use of a three-dimensional numerical model, which will be presented in the Fate and Transport RIR.

Characterization of the Site's geology, hydrogeology, and extent of contamination -- including study of the pathways that could exist -- has been ongoing and is included in the RIRs. A fate and transport analysis will be prepared once all RIRs have been approved, and the analysis will include model simulations of contaminant transport. This report is expected to be submitted by the end of 2021.

Question:

What investigation has been done to identify contamination to soil or groundwater beyond the property boundary (offsite)? If so, when? If not, why not?

Answer:
RIRs must include delineation of contamination in soil and groundwater be approved. Soil impacts have been delineated across the Site and up to the fence lines as noted in each of the RIRs, meaning soil impacts are not shown to extend off-site. The RIRs for AOIs 4 and 9 were not approved due to the need for additional off-site delineation of groundwater impacts. Thus, we have installed off-site wells beyond the property boundaries of both AOIs 4 and 9. Results will be presented in forthcoming RIR Addendums.

Note that the presentation graphics from the August 27, 2020 Public Information Session included the off-site data collected up to the time of the presentation, including new off-site wells. We have collected additional data since the presentation for the AOI 4 off-site wells, which will be included in the AOI 4 RIR Addendum. The RIR Addendums for both AOI 4 and AOI 9 must be submitted by September 2021 to meet interim goals outlined in the First Amendment to Consent Order and Agreement.

Question

MTBE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.

Answer:
That is correct. There are multiple compounds that have been detected in groundwater at the Site above statewide health standards, as reported in RIRs. MTBE and other compounds that are present above the statewide health standards in groundwater will be evaluated in relation to remedial action in future Act 2 submittals, including Risk Assessment and Cleanup Plans. Some of the interim groundwater remedial systems currently address groundwater with impacts above the statewide health standards, including MTBE, along Site boundaries. These systems, along with other remedial measures, will be evaluated in future Act 2 submittals.

The following questions are similar, so a combined answer is provided to address these related questions.

Question

The refinery was historically coal-fired. Where and how has the site been tested for Arsenic

Question

Should other heavy metals be expected to be found given the history of heavy industrial use?

Question

Why is lead the only metals COC? Aren't there other contaminants such as copper, cadmium, arsenic that come from refining processes?

Question:
Evergreen fails to properly delineate the contamination of arsenic, manganese, and other inorganics (metals) in the unconfined aquifer and the deep aquifer.

Answer:
We tested the Site for a complete list of metals as part of the 1992 EPA Resource Conservation and Recovery Act (RCRA) Facility Investigation, and none of these metals – with the exception of lead –were identified as contaminants of concern. The 1992 report is posted on the Evergreen website for reference.

We have sampled both soil and groundwater samples from various areas of the Site with history of crude storage and processing for a more comprehensive analyte list, which included other metals as part of the remedial investigation activities. These data have all been included in the RIRs.

Evergreen is pursuing an Act 2 release of liability for only the compounds that are identified on the site list as contaminants of concern.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
Could you talk more about the topmost 'fill' layer in the Environmental Setting slides … how deep is this fill, what is it composed of? When was it added there?

Question:
What is the composition of the layer labeled 'Fill'? Does Evergreen know from where the fill was obtained? Is river dredging/channel widening one possible source for this fill?

Answer:
Much of the former refinery and surrounding area is underlain by historic fill material, which was primarily placed for the purpose of reclaiming lowlands along the banks of the tidal Delaware and Schuylkill Rivers during industrialization. The fill materials are heterogeneous in nature and have been characterized as a mixture of compacted soil and anthropogenic debris, including sand, clay, silt, gravel, cinders, concrete, asphalt, crushed stone, ash, glass, brick fragments, and wood. Apparent fill thickness ranges from a veneer, where historic land surfaces were highest, to more than 20 feet deep, within the locations of former lowlands such as stream valleys, marshes, and open pits.

Fill may or may not have been encountered in each boring. If fill was encountered and was characterized by the person logging the hole, the boring log would contain the description. Evergreen is not aware of and cannot speculate on all potential sources of historic fill at the site. The general descriptor "fill" is not necessarily indicative of imported materials but of disturbed native soils with man-made debris.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
Since Evergreen used an inappropriate standard as a basis for its remedial investigation reports, how does it justify that it has correctly defined the extent of lead contamination?

Question:
Lead looks to be close to the edge of the site which is close to residential areas. Are you willing to commit to cleaning up the lead to residential standards in areas of the property that are closer to residential areas?

Question:
Evergreen fails to sufficiently delineate exceedances of the soil-to-groundwater numeric value and the direct contact numeric value for all constituents of concern.

Answer:

RIRs must include delineation of soil contamination, including all analyzed compounds, and must be approved by the PADEP. We compared all compounds of concern to their respective soil-to-groundwater, medium-specific concentration, as illustrated in RIR data tables, and delineated to the direct-contact, medium-specific concentrations in both surface and subsurface soil based on existing exposure pathways, as illustrated in RIR figures. This delineation is conducted up to the fence line or other boundaries of the property, as required by Act 2.

The exception to this is lead in surface soil only, which was delineated to the site-specific standard based on a direct-contact pathway and updated model calculations. As noted in response to other questions concerning lead, the calculation of the site-specific standard was appropriate in accordance with Act 2 regulations and recommendations from the USEPA and the PADEP.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
Evergreen may not fragment the Remedial Investigation Reports by diverting its deficiencies into a future Fate and Transport Remedial Investigation Report.

Question:
Once again, you are dealing with a corporate entity not dedicated to much beyond its profits and quite willing to put the health of its workers and the public at risk. The way this corporation has divided its reports, delayed releasing updates, promises to report later regarding crucial elements of the project that are needed to make a final decision is NOT the kind of behavior we want to see in our region. I find this appalling and needs to be separately addressed.

Answer:
All RIRs do contain fate and transport analysis. Earlier AOI reports used the Domenico model to analyze the individual AOI areas. The decision to complete a site-wide fate and transport model to be included in a separate RIR allows Evergreen to evaluate groundwater flow and contaminant transport on a site-wide basis, since the groundwater conditions are not bound by AOI boundaries. This cannot be completed until each of the AOIs has been adequately characterized (indicated by agency approval of all RIRs). In addition, the proposed Fate and Transport RIR will use a robust numerical 3D groundwater model, which can more accurately predict groundwater contamination movement. Also note that the most recent RIRs for each of the AOIs do include fate and transport in the form of qualitative analysis, as allowed under Act 2.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:

Can you comment on why AOI 11 deep groundwater report has not yet been approved?

Question:
AOI 11 has deep aquifer contamination that was not accepted by the DEP. Please discuss the extent of pollution, its evaluation and anticipated cleanup timeline.

Answer:
Evergreen submitted both an AOI 11 RIR and a Final Report, and both were disapproved solely for the fate and transport analysis that was included in the reports. The remedial investigation portion of those reports were acceptable. Note that before we started a site-wide model concept, each of the AOI reports had separate individual models completed and we have since updated that approach. Because the only disapproval aspects for the AOI 11 reports were based on the fate and transport, in subsequent discussions with PADEP we decided that the next phase of reporting for AOI 11 would be in the site-wide Fate and Transport RIR. Also note that AOI 11 has been monitored continually and data has been reported for AOI 11 in other AOI RIRs.

Per the 2020 First Amendment to Consent Order and Agreement, the Fate and Transport RIR is due by Dec. 31, 2021, and a Final Report for Sitewide Groundwater is due by Dec. 31, 2024.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:

Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

Question:

Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Question:
I am writing to state that the RIRs presented are so flawed that even those that were previously approved by DEP (without adequate public review) need to be rejected, improved significantly at least as described below and in other's detailed comments, and then resubmitted for public review and comment before they are used to develop long-term remediation plans. It is not necessary to stop ongoing remediation, but future remediation should not be limited by using incomplete and potentially inaccurate data.

Question:
The data in these reports was mostly collected between 2011 and 2017, and are too old to be trusted to reflect the current conditions and contaminants in all areas. The amount of time passed, the additional

pollution from several years of refinery operation and fires, and the heavy rainfall that the area has received in the past decade all probably resulted in changes or movement of some or all contaminants, including moving more off-site and into the lower aquifer. New sampling needs to be conducted in all areas, on land and in water, to both verify actual conditions and contaminants and to test for contamination that was not tested for at all (like PFAS compounds), and to test some areas, like both shallow and deep portions of the aquifer, more thoroughly. As new sampling is done, if it becomes apparent that the old "edges" of contamination have moved, the sampling areas need to be enlarged until new "edges" are well-established.

Question:
Evergreen needs to revise its remedial investigation reports to conform both with evolving scientific knowledge AND with the evolving state of our world due (at least in part) to changes brought on by climate change.

Question:
Evergreen completed its remedial investigation reports over three years ago. Given the fire incidents and other changes during that time, relying on older data seems questionable. Evergreen should provide evidence that data from these reports are still representative.

Question:
All of the RIRs, as well as the Ecological Risk Assessment and the Site Wide Lead Human Health Risk Assessment, were completed between June 2011 and December 2017. As all of these reports are now three to ten years old, we request that Evergreen demonstrate that the data in the RIRs remains consistent with the site's current conditions.

Question:

Climate change presents one of the most significant threats to the health, safety, and sustainability of our communities. Flooding is one of Philadelphia's central climate vulnerabilities, and the location of the former refinery site puts it at significant risk. At present, Evergreen has not included any climate change impact analysis in its RIRs or released any other information on how climate change will impact the site and how that could change the necessary remediation efforts. EPA Region III has released policy guidance stating that sea level rise should be considered as part of the remedial investigation stage.10 We request that you follow this guidance and update all relevant Act 2 materials to include the impacts of climate change on the site.

Question:
Evergreen's Conceptual Site Model is fundamentally flawed, necessitating substantially revised reports for public comment before submission to the Department.

Question:
Evergreen should revise the reports to reflect up-to-date material (including data and analyses from Groundwater Monitoring Status Reports).

Question:
The Remedial Investigation Reports are deficient because they fail to address the impacts of climate change – including sea level rise and storm surges.

Answer:

It is important to remember that Evergreen is responsible for investigating and remediating contamination that was present up until the time of the sale of the facility to Philadelphia Energy Solutions (PES) in 2012. Any releases or emissions from refinery operations or other site activities after 2012 are the responsibility of the new property owners.

The RIRs that PADEP requested to be "reopened" for public comment were submitted over various years between 2011 and 2017. They included all historic data, including data collected up until the time of the report. At the time of their review, PADEP determined in their approvals that data included in the reports was reliable. The potential effects of climate change will be determined in the future contaminant Fate and Transport RIR.

Groundwater analytical data and field measurements are collected routinely from the wells at the facility, not just as part of remedial investigations. The RIRs presented all historic and current data up to the time of the reports; however, additional data has been collected since those dates. The groundwater quality figures presented in the August 27, 2020 Public Information Session included data up through and including 2019. The current "edges" of plumes are defined not only by past data, but by data collected recently, and also will be evaluated using future laboratory data and predicted through fate and transport modeling.

Soil data also spans many years, as multiple characterization activities have been conducted in each of the AOIs. Many of the areas of focused soil sampling included efforts to characterize and delineate past releases/issues/historic activities, not ongoing ones. Therefore, data collected closer to the time of release versus later in time would be more conservative as petroleum compounds naturally degrade over time, while data collected to delineate a past release would more accurately reflect current conditions. Evergreen contends that the soil data included in the RIRs accurately characterizes the environmental impacts that Evergreen is responsible to investigate under the Act 2 Program. Hilco Redevelopment Partners and Evergreen will also collect a significant amount of additional soil data as part of the development process. We will develop the Cleanup Plan(s) using all appropriate data.

The Groundwater Remediation Status Reports, which are submitted to the PADEP, are meant to provide brief updates on data collected and remediation activities throughout the Act 2 process, including during the time between RIR submittals and after the RIR process is complete. Any and all data collected up until the time of an RIR was included in the RIR reports, and any new data collected subsequent to RIRs are included in RIR addendums or other Act 2 reports including the Fate and Transport RIR and the Cleanup Plan. Since new data are included in future Act 2 reports, already approved RIRs are not updated as new data is collected.. The Conceptual Site Model (CSM), which is discussed in each of the RIRs, was also approved by PADEP. However, Evergreen noted in its presentation that a CSM is continually updated as new data/information is known about a site. We will utilize the results of all RIR activities – along with any subsequent data as both soil and groundwater data continue to be collected– in future CSMs in the Fate and Transport RIR and Cleanup Plan to support future determination of necessary remediation.

Question:
Regarding the soil-to-groundwater value, did you compare the soil concentrations to the soil-to-groundwater number and the site-specific number? If so, it didn't seem like the soil-to-groundwater number was given enough consideration or serious analysis.

Answer:
In the RIRs, the soil concentrations were compared to the statewide health standard soil-to-groundwater number, the statewide health standard direct contact number, and the site-specific number (for lead only). We have hundreds of wells on site that provide groundwater concentrations, and we evaluate groundwater concentrations of all compounds of concern, not just those that have exceeded soil-to-groundwater Medium-Specific Concentrations (MSCs). With respect to soil, the direct-contact number was utilized for comparison based on the existing pathway of exposure.

Question:

Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.

Answer:
As shown in the RIRs, benzene is present in groundwater but is less extensive in soil. While concentrations of benzene in soil and groundwater exceed the statewide health standards in sampling locations, the concentrations in soil and groundwater have not been shown to emit high levels of benzene into the atmosphere. Many samples have already been collected to evaluate benzene in air, and part of the future fate and transport assessment and cleanup plan activities includes further vapor-intrusion assessment, which looks at potential for migration of vapors from soil and groundwater.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
This comment regards the benzene groundwater contamination on the Verizon SDWC property and subsequent properties. There does not seem to be sufficient sampling points located on the properties to the north of N-3 or west of V-MW-9 to accurately estimate the true extent of the plume. Similarly there appears to be insufficient data points to the north east of V-MW-16 on the north part of the Verizon SDWC property to properly determine a contaminant boundary . Was subsequent sampling and monitoring performed alongside I-76 or on the other side of the highway near the Philadelphia Housing Authority building to further delineate offsite impacts? Water level gradients seem to indicate slight a NE flow off of the Verizon SDWC that this report did not consider or investigate.

Question:
In addition the pump-and-treat system along Maiden Ln does not look like it changes the gradient of the plume that extends to the Verizon SDWC property and beyond. What is being done to properly delineate and mitigate this off-site benzene issue?

Answer:

The Verizon SDWC property is a separate remediation site. A Site Characterization Report indicating closure via a combination of the statewide health standard and site-specific standard was submitted by the property owners and approved in 2012. A subsequent site-specific standard Remedial Action Plan was approved in 2012. A Remedial Action Completion Report was submitted in 2015, in which they requested closure via a combination of statewide health, site-specific, and background standards due to impacts at the southern property boundary, which is across Maiden Lane from the former refinery.

Groundwater gradient in the area between the Verizon property and the area of the remediation system along Maiden Lane is shallow, but we generally observe a groundwater flow pattern that indicates convergence in the vicinity of the AOI 8 boundary with Maiden Lane, near the Mifflin Street Sewer.

The benzene dataset presented in Figure 9-2 of the AOI 8 RIR utilized maximum concentrations from 2014-2016 groundwater sampling, as this was the most comprehensive dataset at the time. It should be noted that benzene concentrations measured in groundwater varied through that time period (as low as 6.2 micrograms per liter (ug/L) in a V-MW-9 groundwater sample on March 16, 2016; benzene was not detected in well N-3 groundwater samples on June 2, 2014, March 17, 2016, and May 27, 2016; benzene was not detected in well V-MW-16 groundwater samples on April 17, 2014, June 25, 2014, September 5, 2014, and March 16, 2016 (See AOI 8 RIR Table 4-2). An overall decreasing benzene trend in this area was demonstrated in the RIR in Figure 9-5b.

Subsequent gauging and sampling support the RIR interpretations of groundwater flow patterns in this area and indicates recent N-3 benzene concentrations ranging from non-detect to 6.75 ug/L in groundwater. We will continue to monitor the area wells and incorporate data into future modeling efforts.

A horizontal recovery well was installed in that area for the purpose of LNAPL recovery as well as to mitigate any potential migration of dissolved contaminants away from AOI 8. The treatment system in that location was started up in January 2021. Therefore, you would not have seen any changes in the groundwater gradient as a result of pumping in reports submitted prior to that time.

3.0 ADDITIONAL COMMENTS AND RESPONSES

Section 3.0 summarizes the comments from the public that were not specifically related to past Act 2 reports and includes Evergreen's responses to these comments. For ease of review, questions with similar subject matter are provided under an appropriate topic heading; while many questions could be assigned to multiple topics, each question is only included once in this document.

Air Quality

Question:
Are chemicals you are presently using putting additional toxins in the air?

Answer:
Evergreen does not use chemicals in its current remediation systems.

Question:
I read that Benzene levels were 30 times higher than permitted, putting them on par with levels you would see in 3rd world countries like India. Also watchdog websites went black in the weeks leading up to the explosion. There was no data available to the public in the weeks leading up to the explosion.

Answer:
Evergreen is responsible for managing the environmental investigation and cleanup of soil and groundwater from impacts that occurred before PES purchased the site in 2012. PES has operated the site since then and would have the information pertaining to any recent air emission data. In addition, the City of Philadelphia Department of Public Health's Air Management Services may be able to provide additional air quality data from that time period: (215) 685-7584 or dphams_service_requests@phila.gov.

Question:

Hi, I live in Siena place. I noticed that Benzene concentration is a light green and close to the dark green shaded areas in the same spot as my current house (very close to pha housing and refinery) *(Evergreen note: this question refers to slide #38 "Groundwater Investigation Results – Benzene" in the Aug. 27, 2020, presentation which is available for view or download on www.phillyrefinerycleanup.info).* I think it was in the lower aquifer and water table aquifer. Because it is right below my house it seems from the map, can this present a danger to me or the house? Like can my water and be affected? And gas vapors be present? Or is it totally safe to live in this area even though it is below ground?

Answer:
Information from the remedial investigation activities does not indicate that there is any risk to indoor or outside air in off-site properties from benzene in groundwater originating from the Site. Generally, Act 2 requires an evaluation of vapors to indoor and outdoor air from a dissolved plume beneath the subsurface;. that evaluation will be included in future Act 2 reports, to be submitted upon completion of all RIRs. Please note that the slide being referenced shows refinery data as well as data collected from

other nearby Act 2 sites. Subsurface impacts originating from other Act 2 sites are evaluated by the appropriate responsible parties who are remediating those Sites.

Question:
Now I'm smelling and feeling the toxic pollution from the refinery again.

Answer:
There is no indication of off-site air impacts from the historic subsurface environmental impacts to soil and groundwater that Evergreen is investigating and remediating. Additional information concerning air quality from either the EPA or the City of Philadelphia may be helpful to identify the source of any smells.

Question:
Right now there is a very strange smell outside. I am inclined to believe it may be emissions from your site. If so, what could it be?

Answer:
The operation of the site has been under the direction of PES since the sale of the site in 2012 from Sunoco to PES. In addition, PES operations at the former refinery were shut down in 2019, so we are unsure of what recent smell you are referring to. The City of Philadelphia maintains air monitoring in the vicinity of the site, which is summarized in its 2020-2021 Air Monitoring Network Plan: https://www.phila.gov/media/20200504115105/2020-2021_AMNP_DRAFT_FINAL__20200424.pdf

---

Question:
I currently reside in Siena Place near the borderline of the refinery. I just want to know is it safe to live there in terms of air quality and in regards to the plume status. Recently, I have smelled gas outside approximately on a few occasions near the end of July and don't know if that is from the refinery or cleanup process as the refinery is not currently operating.

Answer:
Refining operations were shut down in 2019. Evergreen is unaware of other site activities at the facility since that time, so we are unsure of the source of any odors. PES operated the site and would have information pertaining to air-emission data. In addition, the City of Philadelphia Department of Public Health's Air Management Services may also be able to provide additional air quality data from that time period: (215) 685-7584 or dphams_service_requests@phila.gov. The City of Philadelphia maintains air monitoring in the vicinity of the site, which is summarized in its 2020-2021 Air Monitoring Network Plan: https://www.phila.gov/media/20200504115105/2020-2021_AMNP_DRAFT_FINAL__20200424.pdf.

Evergreen is responsible for investigation and cleanup of subsurface conditions present at the property before the sale to PES in 2012. Part of Evergreen's investigation involves defining the extent of contamination in groundwater (the plume) and determine if the impacts present a risk to people on site and those located near the Site. Evergreen operates remediation systems at the facility to control groundwater contamination and to control vapors in sewers near and through the facility. Based on the

completed investigations, the environmental impacts to soil and groundwater have not shown to cause impact to indoor or outdoor air in residential areas off site.

Question

Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Answer:
Evergreen must investigate air quality arising from subsurface contamination only, not from refinery operations above ground. As documented in the RIRs, air samples were collected from inside site buildings, and from outdoor air locations, both as background and above areas of known LNAPL plumes. Based on the data collected in the RIRs there are no known residential areas where the contaminated groundwater has migrated from the facility to beneath those areas, therefore no off-site air sampling is planned. The future fate and transport RIR will present the results of fate and transport modeling of groundwater plumes which will show the projected extent of groundwater contaminants over time.

Climate Change

Question:
A) On the Q+A page, responding to the question "The hydrological situation is changing …" Evergreen's response includes the words "climate changes predicted to occur within the anticipated timeframe to completion will be considered." B) On the Q+A page, responding to the question "Climate change-generated sea-level rise (Schuylkill, Delaware) is a given" Evergreen's response includes the words "… i.e., how many years are predicted for Evergreen to meet Cleanup goals under Act 2 compared to the magnitude of climate change predictions within that general time period." Both of these responses imply that only the amount of sea-level rise that occurs during the clean-up operation will be considered. However, sea level rise will continue to affect the site for decades, or perhaps centuries. 1. Can Evergreen confirm (in plain English) that it is only considering sea-level rise for the duration of the remediation project? 2. If so, why is Evergreen not considering long-term sea level rise and its impact on aquifers into account, when considering the remediation plans for the site?

Answer:
It is Evergreen's intent to consider climate changes predicted to occur within the timeframe of cleanup of the Site. In general, this timeframe would be considered "long term," as petroleum contaminants in groundwater may take decades to remediate and/or degrade to concentrations below regulated standards.

Follow-up question to the question above: *Can you expand on your use of quotes for "long term" in this reply. Do you consider this a reference to Act 2, Sec. 304 – site-specific standards?*

Because long is a relevant descriptor of time that is subject to interpretation, Evergreen's use of quotes in this response was meant to add context to the comparison of the anticipated remediation timeframe and a changing climate as both being long-term considerations. Evergreen has selected a combination of Act 2 standards for cleanup of the Site, and this response wasn't in reference to any particular standard.

Follow-up question to the question above: *In the zoom meeting of December 2020, it was pointed out that climate change will continue after the remediation. The Evergreen position was clarified to state that Evergreen will follow climate change data and predictions up until 2100, which is the current limit for reliable modeling that is accepted in the wider scientific community. Can you confirm that this is Evergreen's policy? [Evergreen note: Evergreen held virtual meetings in August 27, 2020 and January 2021].*

Evergreen does not have a policy on this matter. It is Evergreen's intent to consider peer-reviewed and published climate change predictions based on modeling studies for, or inclusive of, the Philadelphia region. To date, the year 2100 generally appears to be the most widely cited future limit for reliable climate predictions in the area. Evergreen's assessment of potential climate change impacts on the groundwater model used for fate and transport will work within this timeframe.

Question:
On the Q+A page, responding to the question "Evergreen's answer on the website to the question of whether climate change will be incorporated in the groundwater modeling …", Evergreen's response includes the sentence "Evergreen plans to evaluate climate change data … will include a review of

available literature on climate change predictions for the Philadelphia region." 1. It would be useful to see which sources Evergreen is consulting. Will Evergreen share a bibliography of the sources that you have consulted with the public?

Answer:
Yes, Evergreen's Fate and Transport RIR will include a references section with all cited publications and resources used in the groundwater modeling. Evergreen is also planning future meetings to discuss the model and input values.

Question:
On the Q+A page, responding to the question "Why is there no mention of climate change in discussion of the Water-table aquifer? …", the response includes the sentence "Evergreen recognizes that climate changes are predicted that could alter local hydrologic conditions near the facility, such as higher water levels in the water-table aquifer or higher tides in the Schuylkill River." This misrepresents the nature of climate change and sea level rise. It's not a question of higher tides. Everything will be higher - low tides, mean water levels, and high tides. Everything is going to go up. This will affect both the Schuylkill (as far as it is tidal, to the art museum), and the Delaware. 1. What sources and estimates for climate change and sea level rise is Evergreen working with? 2. What is the maximum value for sea level rise that Evergreen is considering? 3. Sea-levels will continue to rise at least into the next century. What time-scale, in terms of years from now, does Evergreen consider adequate to 'future proof' the site from rising sea levels?

Answer:
Most of Evergreen's groundwater modeling efforts to date have focused on the development of a baseline model that is calibrated to simulate current, average conditions. Evergreen is presently reviewing available documentation pertaining to climate changes predicted for the Philadelphia region. Data review is in its early stages, as the Fate and Transport RIR is proposed for submittal at the end of 2021. However, the model and input parameters considered will be discussed during future outreach efforts.

Question:
I think we're asking the same questions about climate change/sea level rise etc., because we cannot parse/understand the answers that have been posted on the web site.

Answer:
As noted, we will consider climate change in future contaminant modeling efforts. Most questions posed to date cannot be answered specifically because we are not at that phase in the Act 2 process yet. We can say that Evergreen will consider questions, comments and input relating to climate change received during the comment period for past Act 2 reports in future modeling efforts, and there will be opportunity to discuss this during follow-up meetings and/or group discussions, which should provide clarity on how climate change may be incorporated into groundwater modeling and remediation at the facility.

Question:
Climate change-generated sea-level rise (Schuylkill, Delaware) is a given. There are already models out there. What range of values in feet are Evergreen assuming for 2050, and 2100?

Answer:
Evergreen has yet to complete the contaminant fate and transport assessment for the facility and currently has a working groundwater flow model that is calibrated to recent, average sea level in the Schuylkill River, estimated from a local tide gauge. The magnitude of sea-level rise has not yet been selected for evaluation in the modeling and is pending a literature review of available resources and initial modeling results to understand the time constraints on contaminant fate under Act 2 (i.e., how many years are predicted for Evergreen to meet cleanup goals under Act 2 compared to the magnitude of climate change predictions within that general time period).

Question:
Evergreen's answer on the website to the question of whether climate change will be incorporated in the groundwater modeling states, "the boundary condition data variability must be quantifiable and based on accepted models or observations." What in plain language does this response mean? You have not directly answered the question. What efforts are being made to quantify the boundary condition data? Are accepted models available or not? If not, why not?

Answer:
Evergreen plans to evaluate climate change data in support of groundwater modeling for contaminant fate and transport. The effort will include a review of available literature on climate change predictions for the Philadelphia region. Accepted climate models would be those that are published, peer-reviewed, and/or otherwise viewed as reliable and relevant to future conditions at the facility. Quantifiable refers to the need for climate change data to be numeric in nature so that the values can be incorporated into Evergreen's modeling.

Question:
Why is there no mention of climate change in discussion of the Water-table aquifer? These levels could change by multiple feet in the next few decades.

Answer:
One of Evergreen's primary objectives through the remedial investigations under Act 2 was to characterize the facility's geologic framework and the water-bearing units it supports. Potential flow pathways for contaminant transport could be evaluated in this manner using recent groundwater observations from hundreds of wells at the facility. Evergreen's groundwater model is calibrated and validated to this recent groundwater data to provide fate-and-transport simulations that are based on current conditions. A sensitivity analysis was performed on the groundwater model to evaluate the impact of changes to inputs on performance and increase confidence in its ability to make predictions.

Evergreen recognizes that climate changes are predicted that could alter local hydrologic conditions near the facility, such as higher water levels in the water-table aquifer or higher tides in the Schuylkill River. An assessment of climate change from available, published resources and the potential implications to Evergreen's groundwater model will be included in the upcoming Fate and Transport RIR.

Question:
Does your careful evaluation of pollutant concentrations, water levels, plumes etc. take account of future rises in sea level due to global warming, the fact that some portion of the site (perhaps most of it) will be underwater by the end of the century), also the value of restoring some of the site to the wetland it used to be for relation between land and water?

Answer:
The remedial investigations performed to date sought to characterize the facility's current and past conditions, delineate petroleum contamination, and form a basis for making predictions of future conditions. Evergreen recognizes that changes to climate are predicted to occur and may impact the facility in the future, and that these changes should be evaluated within the timeframe of the Act 2 remediation.

The question was also provided to Hilco Redevelopment Partners, who provided the following response: Hilco has plans for significant earth work to raise ground-surface elevations in areas potentially susceptible to flooding. Approximately 4 million cubic yards of soil are expected to be moved in order to raise the ground surface elevations on the portion of the Site east of the Schuylkill River above base flood elevations (BFE). Some of the ground surface elevations at the Site are currently below BFE while other areas are above BFE. Hilco plans to move soils from locations with higher ground surface elevations to areas with lower ground surface elevations so that the final grades for all areas of the site east of the Schuylkill River achieve the design standard of being above the BFE as established by the Federal Emergency Management Agency. Specifically, all parking lots will be above the BFE and all building floor slabs will be more than 4 feet above the BFE. All building floor slabs will also be above the 500-year floodplain. None of the soils that are moved as part of the regrading process will be placed in areas below the groundwater table. Hilco is raising elevations above and beyond what is required by statute and regulations to take resiliency and climate change into account.

Question:
Could you clarify the period in which you are considering climate change projections? Is it the period of remediation or the post-remediation use of the site? If it's post-remediation, what assumption are you using for future climate change?

Answer:
At a minimum, we anticipate looking at several decades to be considered for climate change projections. This process is ongoing, however, and will continue to be evaluated to see if longer time frames are necessary as the Fate & Transport RIR is completed this year.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
Here's another example of where responses could be clearer. In response to questions about tide gates, the answer on the site is (partly):

"The tide gates at the Site were not specifically designed to address sea level rise; however, the Site will continue to be regulated under the stormwater management requirements of the City of Philadelphia and the PADEP which includes provisions for sea level rise."

But it would be good to citations of these claims - what documents are these requirements contained in, and where can they be found? As it is the answer is kind of an answer but not very useful.

Question:
What sea level rise, if any, was the tide gate built to accommodate?

Answer:
Tide gates are a common flood-prevention structure for areas in a tidal zone. Tide gates close during incoming tides to prevent inundation from downstream water propagating inland, and they open during outgoing tides to drain upland areas. The tide gates at the Site were not specifically designed to address sea level rise; however, the Site will continue to be regulated under the stormwater management requirements of the City of Philadelphia and the PADEP, which includes provisions for sea level rise.

The tide gate was installed by Sunoco long ago and it was installed specifically to address oil in the sewer at the time. There are remediation systems in place to address the potential for oil to migrate into those sewers; therefore, in the future the tide gate may not be necessary. As noted, climate change is something that will be included in the fate and transport modeling which will be presented in the Fate and Transport RIR. Any climate change resources used in future modeling efforts will be referenced in the Fate and Transport RIR and the Cleanup Plan.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
The hydrological situation is changing. Are you considering remediation strategies with respect to sea-level rise, which could affect groundwater on the site?

Question:
Are you considering your remediation strategies with respect to sea level rise, which could affect groundwater and will you be incorporating changes resulting from climate change, sea level rise and frequency of storms into groundwater modeling.

Question:
What plans do you have to keep this site safe as precipitations and sea level rise increase due to climate change?

Question:
As a Philadelphia resident and concerned citizen, I've been disturbed and frustrated to learn about the former PES refinery site and the legacy of toxins and pollutants it has left on the environmental justice community that surrounds the refinery. The opportunity to clean up and redevelop the refinery is a once in a lifetime chance to repair the biggest blight of our region. And as greenhouse gas emissions continue to rise and we know sea level rise, storm surge and precipitation events will continue to worsen. Evergreen must ensure its remedial investigation adequately addresses these future climate change

conditions. For the +150 years this community has suffered from the presence of this refinery, we owe it to this community to ensure their health will be protected once this site is finally cleaned up.

Answer:
Evergreen will detail its approach to remediation of the facility in future Cleanup Plans and will consider climate changes predicted to occur within the anticipated timeframe to completion. Evergreen will also incorporate climate change into future modeling.

The following questions are similar, so a combined answer is provided to address these related questions.

Will Evergreen be incorporating climate resilience into its groundwater modeling?

Question:

Specifically, I call on you to include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Question:

Contaminated groundwater in this low-lying geographic region will be affected by sea-level rise and frequent superstorms ushered in by the climate crisis.

Answer:
A literature review of available, published resources on climate change for the Philadelphia region and discussion of the potential implications to Evergreen's groundwater model will be included in the upcoming Fate and Transport RIR.

Evergreen's groundwater flow model for the former Philadelphia Refinery has been calibrated and validated to recent environmental conditions and measured observations. As a part of the remedial investigation's contaminant fate and transport assessment, Evergreen will review available information related to climate change in the Philadelphia area and, if warranted, the groundwater model could be adjusted to adapt to predicted climate conditions and could provide a range of potential outcomes for consideration (e.g., a higher average Schuylkill River stage due to sea-level rise or an increased recharge rate due to an increase in annual precipitation). For a defensible model and reliable predictions, the boundary condition data variability must be quantifiable and based on accepted models or observations.

Fate and Transport

Question:
What is the status of your groundwater and aquifer modeling for all pollutants?

Answer:
The groundwater flow model has been completed but cannot be finalized and submitted until all RIRs are approved, as data collected for RIRs are used as the basis for the groundwater flow model. Groundwater contaminant fate and transport model efforts will be conducted subsequent to approval of the RIRs since the fate and transport modeling is dependent upon the information in the RIRs and the groundwater flow model.

Question:
How much more information do you need to complete the fate and transport model?

Answer:
We believe we have sufficient information to complete the model. However, we need to have agreeance from PADEP prior to submittal. In other words, all of the RIRs must be approved first, which signals that PADEP feels we have sufficiently defined the contamination so that a model can be accurate and complete. Once the RIR Addendums for AOIs 4 and 9 are submitted and approved, the fate and transport model will be finalized and submitted to PADEP for approval.

Groundwater

Question:
There is a benzene pool that extends toward residential neighborhoods of South Philadelphia. In June 2019, PES reported fence line measurements of benzene above regulatory limits. What's the situation? What corrective actions have been taken?

Answer:
Dissolved benzene in groundwater (otherwise known as a benzene groundwater plume) is present at the former Philadelphia Refinery. The RIRs summarize the benzene in groundwater that Evergreen has characterized as part of the Act 2 investigations. For example, the AOI 1 RIR presents details concerning benzene in groundwater along the eastern boundary of the former Philadelphia Refinery. These reports also summarize the interim remedial activities to address environmental impacts, including groundwater and vapor remediation systems that exist along the property boundary on 26th Street. Part of the Act 2 processes include evaluating potential impact to off-site properties, including residences. These evaluations show that the dissolved benzene impacted groundwater beneath AOI 1 is not likely to migrate under nearby residential areas, and that there are no air impacts from the benzene groundwater plume to off-site properties. Evergreen prepared an overall summary slide of benzene in groundwater beneath the whole facility due to on-site and off-site sources for presentation during the November 2019 public meeting. The presentation is posted to Evergreen's website (https://phillyrefinerycleanup.info/). . PES, as owner and operator of the facility, was required to report fence line measurements of benzene based on air emissions from PES' operations. This air monitoring is unrelated to the subsurface benzene groundwater plume and Evergreen does not have the information to be able to address the portion of your question related to the 2019 PES-reported fence line monitoring.

Question:
Has AOI 11 cleanup been started? What is the plan for the cleanup for AOI 11?

Answer:
Additional investigation has been completed for AOI 11 since the time of the last RIR submitted solely for AOI 11 in 2013. In fact, the latest RIRs for each of the AOIs include information about AOI 11, or the lower groundwater, within that AOI. We chose to incorporate AOI 11 into the other AOI RIRs in order to give a full description of groundwater within each AOI in these reports. After the RIRs are all submitted and approved, Risk Assessment and Cleanup Plans will be submitted for different areas of the site. The proposed cleanup for AOI 11 will be included in the Cleanup Plans. Note that active ongoing remediation efforts in shallow groundwater to remove petroleum products and contaminated groundwater have likely had a positive effect on AOI 11 groundwater quality through source removal. In addition, natural processes work to break down petroleum in the subsurface.

Question:
When will the public hearings for AOI 11 under Act 2 take place?

Answer:
There is currently no separate meeting planned to discuss AOI 11. Evergreen held a Public Information Session on Aug. 27, 2020, during which the environmental data collected from all AOIs was reviewed with the public. Additional meetings are planned to be held for future Act 2 submittals and/or other key milestones in the Act 2 process, some of which will include information about AOI 11. The public is encouraged to ask questions and provide comments to any report submitted during the Act 2 process. Notices will be sent to the public via newspapers, as well as an email to interested parties for all future report submittals and meetings.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
There has been some concern that because of the aquifer under the water, pollutants from the refinery may impact drinking water in downstream New Jersey. Do you think this was ever a concern? If yes, will it continue to be one even as the refinery shuts down?

Question:
I am a New Jersey resident who is extremely concerned about the potential for groundwater contamination at the PES refinery site and how it could affect my young child. The area has been highly contaminated for a century, and residents of both Pennsylvania and New Jersey are now well aware of the dangers posed by groundwater contamination, following high-profile cases in Tom's River, NJ, and the now-confirmed systemic drinking water contamination occurring as a result of fracking the Marcellus Shale. Please follow the advice of experts at the Clean Air Council and perform an immediate and thorough and plan to identify and remediate contamination.

Answer:
Evergreen's role is to evaluate and remediate groundwater conditions created based on use of the facility up through 2012. Based on extensive data collected over the last 20+ years and groundwater modeling performed to date, it is highly unlikely that groundwater impacts at the former refinery Site affect drinking water quality in New Jersey. As part of the Act 2 process, Sunoco and Evergreen have performed several preliminary risk assessments, including accounting for the projection of dissolved contaminant migration in groundwater. All assessments to date have shown that conditions with respect to groundwater beneath the facility are protective of human health both on-site and off-site. Evergreen is working on a complete groundwater fate and transport analysis, which projects where and how far contaminants may travel and at what concentrations, as well as other reports that will provide additional and more detailed analysis.

Question:
What are the biggest environmental concerns with the water moving forward as this space is transitioned to a mixed-use industrial site?

Answer:
In general, water concerns remain the same between use of the Site as a refinery and the proposed use by Hilco. As part of the Act 2 process, groundwater quality must be investigated, as well as migration of,

and risks associated with, the contaminants identified. The groundwater beneath the site is not allowed to be used for any potable (human consumption) or industrial use; therefore, the direct exposure to groundwater through these pathways is not identified as a concern. Potential vapor intrusion, or vapors migrating from the groundwater into indoor structures, is being evaluated as part of the investigation process. The proposed redevelopment may increase site elevation, due to the need for added grade for construction, which may help address potential concerns about floodwaters interacting with impacted soils. The remaining pathway to be evaluated is the interaction of groundwater with surface water in the Schuylkill River. The results of the evaluation of this pathway will be presented in a site-wide Fate and Transport RIR. The findings in this report, along with the completion of the Human Health and Ecological Risk Assessment, will determine if additional cleanup measures for groundwater are needed, which will be presented in the Act 2 Cleanup Plan.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
What effect has pollution been in the last 7 years since the last reports on AOI 11 were issued on 6/21/2013?

Question:
We understand that contamination has reached the deep aquifer (area of interest 11), which means we need to clean the water too. We've learned from the Clean Air Council that "while Evergreen has made available semiannual groundwater reports through the first half of 2020, that information is not part of the reports open for public comment".

Answer:
New groundwater data for AOI 11 has been collected since 2013 and it is presented in the RIRs for each of the other AOIs. Overall, most groundwater conditions in the lower groundwater (AOI 11) have been demonstrated to be stable to improving for petroleum-related compounds since the 2013 RIR was submitted. Data collected annually from sampling events conducted after the remedial investigations are included in semi-annual update reports, which are also available on the website. While the updated reports themselves are not Act 2 submittals, the data included within them will be carried forward into future Act 2 reports, such as the Fate and Transport RIR and Cleanup Plan, which are subject to public comment.

Question:
Has NJDEP been involved with any issues on the NJ side of the Delaware River? Have public and municipal water companies in NJ been notified about pollution in the PRM Aquifer water supply? Have they been notified about AOI 11 efforts by PA DEP and EPA?

Answer:
The NJDEP is routinely involved with groundwater investigations of the Potomac-Raritan-Magothy aquifer (PRM) due to source areas located in New Jersey that are not related to impacts in AOI 11. There has been no demonstrated connection between groundwater impacts in AOI 11 due to past refinery operations and the PRM groundwater quality in New Jersey. As such, the NJDEP has not been involved

with cleanup of the former Philadelphia Refinery. AOI 11 groundwater conditions beneath and adjacent to the refinery has not warranted notification of the public or municipal water companies in New Jersey, nor is Evergreen aware that PADEP or EPA have notified these water purveyors that there is a perceived risk to New Jersey groundwater quality stemming from operation of the former Philadelphia Refinery.

Question:
As a former groundwater quality specialist, even small breaks in confining layers can result in significant transfer of contaminants. And, the direction and rates of water movement can change over time, often from groundwater drilling.

Answer:
The direction and rates of groundwater flow are evaluated frequently at the Site, and groundwater samples are collected routinely from various hydrogeologic units beneath the facility. The remedial investigation activities also evaluated the areas where the confining layers in the subsurface were not continuous through the completion of soil borings, installation of monitoring wells, collection of groundwater samples, groundwater elevations, and completion of aquifer tests to determine hydraulic properties of the groundwater units. This data will be used for the upcoming evaluation of contaminant movement in the fate and transport evaluation through the use of a three-dimensional numerical model. This will be presented in the Fate and Transport RIR.

Question:
In today's presentation, the presenter described that water flows within the upper groundwater can only mix with water in the lower groundwater if there is a "hole" in the 'shelf' layer between. Even from a layman's perspective, the airplane-view images provided for comparing the two zones and the ''shelf-like' separation, that pathway appeared quite large–and that it could be a pathway of contaminates. Is this being studied? What is the status of such a report and when would its findings be presented and addressed?

Answer:
Characterization of the Site's geology, hydrogeology, and extent of contamination, including study of the pathways that could exist, has been ongoing and is included in the RIRs. A fate and transport analysis will be prepared once all the RIRs have been approved, and the analysis will include model simulations of contaminant transport. This report is expected to be submitted by the end of 2021.

Question:
Have there been any studies on the effect of the pollution of the PRM in the water supply in NJ, as public and private water companies draw water from it and Phila stopped using it in the 1990's because it was too polluted?

Answer:
Evergreen is not aware of any available studies that evaluate the fate and transport of petroleum hydrocarbon chemicals in groundwater from the Site into New Jersey groundwater. Evergreen plans to complete fate and transport modeling with a numerical groundwater model, which will evaluate the potential migration of petroleum-related chemicals from both the water-table aquifer (AOIs 1-10) and

lower aquifer (AOI 11). Based on data collected to date, there is no indication that petroleum-related chemicals in groundwater from site operations have or will migrate to New Jersey.

There have been several studies of the PRM groundwater unit focusing on groundwater flow and naturally occurring metals, including:

- Historical Ground-Water-Flow Patterns and Trends in Iron Concentrations in the PotomacRaritan-Magothy Aquifer System in parts of Philadelphia, Pennsylvania, and Camden and Gloucester Counties, New Jersey, U.S. Geological Survey, Water-Resources Investigations Report 03-4255, - Schreffler, Curtis, L., 2001.
- Simulation of Ground-Water Flow in the Potomac-Raritan-Magothy Aquifer System Near the Defense Supply Center Philadelphia, and the Point Breeze Refinery, Southern Philadelphia Pennsylvania, U.S. Geological Survey, Water-Resources Investigations Report 01-4218, Sloto, R. A., 2003.

Question:
The benzene graphic is different from one previously presented, which showed different levels of concentration for benzene on and off the site. *(Evergreen note: comment refers to slide 38 "Groundwater Investigation Results: Benzene" from the Aug. 27, 2020, Public Information Session).* The arrow that is pointing to "offsite benzene source areas" is pointing to a residential area and the PGW facility (just west of I76). Who is responsible for cleaning up the off-site contamination under the residential area?

Answer:
The benzene graphic was modified to simplify the presentation and depict where benzene is predicted to be present above the statewide health standard in the water table. The purple arrows were drawn to denote other off-site properties active in Pennsylvania's Act 2 program that have benzene sources in groundwater. These include the Philadelphia Gas Works (PGW) Passyunk Facility, Belmont Terminal, and the former Defense Supply Center Philadelphia. The residential area between I-76 and the PGW facility includes monitoring wells installed by PGW to characterize groundwater conditions. Cleanup under Act 2 would be the responsibility of the party that released the contaminants.

Question:
Will this affect our drinking water?

Answer:
No; the refinery contamination sources discussed during the public information session are not expected to impact local drinking water supplies obtained by the City from the Delaware and Schuylkill Rivers.

Hilco / Redevelopment

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
Have you reached out to Hilco about their clean-up efforts? Will you be monitoring them for accountability over severe toxic chemical spills in the water and soil?

Question:
I believe that Hilco must provide up-to-date, factually correct, and timely information about the status of the site's pollution and the harm pollutants at the site (past, present, and future) and inflicting upon neighboring communities. Currently the burden of asthma and cancer around the site suggest that there are significant health risks that need to be remediated and addressed by Hilco. This solution must include more time for public comment and collaborative and meaningful engagement with residents of neighboring communities impacted by legacy contamination and who will be affected by development.

Answer:
Evergreen will continue to communicate and work with Hilco Redevelopment Partners during its redevelopment so that our investigation and remediation can continue during their redevelopment activities. Evergreen's Cleanup Plan, which will address contamination in soil and groundwater existing up to the date of the sale of the facility to PES in 2012, is being completed under PADEP's Act 2 program and tank program, as well as the EPA's Resource Conservation and Recovery Act program.

The question was also provided to Hilco Redevelopment Partners, who provided the following response: Hilco Redevelopment Partners is responsible for remediation of areas of the site where contamination occurred after September 2012. As Hilco Redevelopment Partners enters these areas of the site into the Act 2 regulatory process, it will conduct Act 2 public involvement activities related to those specific remediation areas. Hilco Redevelopment Partners has also been conducting separate public outreach to inform the community about its redevelopment plans.

Question:
If Hilco is going to help Evergreen throughout the cleanup, then why aren't they on this call and subsequent PIP meetings? *(Evergreen note: question referring to the August 27, 2020 Public Information Session)*

Answer:
Evergreen is responsible for former Sunoco releases that occurred prior to September 2012. Hilco Redevelopment Partners and Evergreen are working together during the site development to ensure that Evergreen's remediation activities continue without disruption, and to coordinate where the development activities need to be considered in developing the remedial plan (for example, placement of vapor barriers in future buildings to address potential vapor migration/exposure).

The question was also provided to Hilco Redevelopment Partners, who provided the following response: Hilco Redevelopment Partners is responsible for remediation at focused areas of the site where contamination occurred after September 2012. As Hilco Redevelopment Partners enters these areas into the Act 2 regulatory process, it will conduct Act 2 public involvement activities related to those

specific remediation areas. Hilco Redevelopments Partners has also been conducting separate public outreach to inform the community about its redevelopment plans. Hilco Redevelopment Partners continually engages with the community through public meetings quarterly, through social media channels, and through the office of corporate affairs. If you have any questions that are not answered please contact: jsessoms@hilcoglobal.com.

Question:
Is there any involvement of Hilco, the new owner?

Answer:
Hilco Redevelopment Partners is not involved in Evergreen's Act 2 program at the site. Hilco Redevelopment Partners will have its own remediation program to manage focused areas where contamination occurred after September 2012; however, the two programs are separate. Evergreen and Hilco Redevelopment Partners will work together to limit disruptions of Evergreen's remediation program during the development activities.

Question:
Philly Inquirer (8/3/2020) says Hilco is calling for an "exposure barrier," instead of removal. How extensive is contamination beyond the site? Concerned this does not address the health and environmental rights of the local community, nor account for sea-level rise and climate change flooding.

Answer:
The off-site impacts are described in the RIRs and two AOIs, AOI 4 and AOI 9, have completed additional investigation activities to delineate off-site impacts. As part of developing future Cleanup Plans for the site, several remedial options will be evaluated, including exposure barriers which may be necessary on-site. Exposure barriers are a general term and may include remedial options such as capping (to eliminate any direct-contact exposure to soil) and vapor barriers (to eliminate any exposure to vapors in a building). Although Evergreen has not developed any Cleanup Plans yet, it is anticipated that exposure barriers will be one of the remedial options that will be considered in accordance with the PADEP's capping guidance. The effects of sea-level rise and/or flooding will be evaluated as part of the Cleanup Plans.

Question:
Do you have any idea what is going to be done with the site, and is there any way to encourage using it as a site for renewable energy for the city?

Answer:
Evergreen is responsible only for the historic contamination that exists below the surface in soil and groundwater at the Site. We are in the process of finishing the investigation activities at the site to identify the extent of the chemicals in soil and groundwater, so we can develop a remediation (cleanup) plan for the site. At various steps in the process, Evergreen will prepare reports and hold public meetings for the Act 2 reports. This information will be posted to the website created for the Act 2 process (https://phillyrefinerycleanup.info). Evergreen will make additional notifications before any additional final cleanup activities specified in the cleanup plans begin.

Hilco Redevelopment Partners plans to redevelop the site into a multi-modal logistics hub and does not plan to operate the site as a refinery. As part of their outreach activities, Hilco Redevelopment Partners will provide more information for specific future site uses as the redevelopment process continues. Evergreen will continue to communicate and work jointly with Hilco Redevelopment Partners so that our investigation and cleanup activities can continue during their redevelopment. Hilco Redevelopment Partners has made outreach to the community with updates on progress at the site. This will continue throughout the life cycle of the development.

Question:
I'm especially interested in the Schuylkill River Bike Path improvements, and would like to get on your email list with redevelopment progress and updates.

Answer:
Site improvements such as this are being conducted by the property owner, Hilco Redevelopment Partners, as part of their redevelopment activities. However, we have added you to Evergreen's email list for future notices regarding legacy remediation.

Question:
Evergreen's priority during the cleanup should be beautifying the riverbank in a way that will adapt with rising water levels.

Answer:
Any site improvements are being conducted by the property owner, Hilco Redevelopment Partners, as part of its redevelopment activities.

Question:
Hilco was responsible for an appalling failure during remediation that put local residents, an immigrant-heavy, environmental justice community, at risk. As part of the remediation process, they had to demolish the former smoke stack from the Plant. Although they had all of the permits necessary, they still completed it in such a way that sent a cloud of potentially toxic chemicals into the air. Chicago Mayor, Lori Lightfoot, commented that "The city was given repeated assurances that Hilco had a solid plan to contain the dust. Clearly that didn't happen," Lightfoot said. "This is absolutely and utterly unacceptable. It's unsafe, it's unsanitary. I would not tolerate this in my neighborhood and we're not going to tolerate it here either." Ultimately, because of the danger that Hilco created to the community, Hilco agreed to pay $370,000 to settle a lawsuit filed by the State.

Answer:
Evergreen provided this question to Hilco Redevelopment Partners, who provided the following response: We have partnered with a best in class demolition contractor who has a great deal of experience demolishing refineries and a strong presence in Philadelphia. They will be implementing an extensive dust mitigation plan and will be working with all appropriate agencies and stakeholders throughout the duration of the project. Every project that we undertake provides lessons learned that we apply to other projects. The demolition in Chicago was conducted according to plan but resulted in dust unintentionally migrating off site. No one was injured, HRP took immediate action to address

concerns of community members, and independent testing of the dust by the Chicago Department of Public Health and the United States Environmental Protection Agency revealed it poses "no apparent health risk to the surrounding community." HRP is proud of its successful history of redevelopment and renewal.

Question:
Did you say that Evergreen will cleanup as Hilco redevelops/builds?

Answer:
Partially. Evergreen has been remediating the site for years and remediation is ongoing. Therefore, Evergreen will have some remedial measures in place before Hilco Redevelopment Partners redevelops an area of the Site, and some remedial measures are part of the development (for example, capping and vapor mitigation measures in a building, if warranted). The timing of the Cleanup Plans will be based on the redevelopment schedule so Evergreen can incorporate the final site use based on the development into the remedial design.

Question:
Trucks with no identifying logos or signage are going into and out of the property and more smoke is coming off of the property lately. Does Evergreen know what is going on with these situations? Is this Evergreen-related or Hilco-related?

Answer:
Evergreen provided this question to Hilco Redevelopment Partners, who provided the following response: Some trucks should be on site assisting Hilco Redevelopment Partners in transforming the site. We have a security check point that everyone must register and produce identification.

Question:
What direct communication have you had with Hilco? They seem unaware of the data you shared that shows how dangerous the site remains and yet Hilco is marketing and promoting the redevelopment of PES site as safe for businesses.

Answer:
Evergreen is in direct communication with Hilco Redevelopment Partners regarding our activities and how that may impact their planned site activities. Evergreen has shared, and plans to continue to share, all data with Hilco Redevelopment Partners.

Question from EPA's contractor SKEO August 6, 2020 Public Meeting:
Can anything be built there after the cleanup?

Answer:

What is built at the property is not determined by Evergreen; however, the future use of the Site must remain non-residential.

LNAPL

Question:
Are the LNAPL bodies in Slide 32 a result of shallow, deep or both wells being gauged? *(Evergreen note: question references Slide 32 in the August 27, 2020, presentation)*

Answer:
Evergreen gauged all site wells, but only those reporting LNAPL were used to create Slide 32. The LNAPL bodies shown during the presentation were drawn using observations from wells screened across the water table (i.e. shallow wells). No deep or lower aquifer wells were used.

General

Question:
I was wondering what your plans are now that Hilco has purchased the land PES and Sunoco both left in shambles.

Answer:
Evergreen is in the process of finishing the investigation activities at the former Philadelphia Refinery to identify the extent of the chemicals in soil and groundwater, in order to develop a remediation (cleanup) plan for the site. At various steps in the process, Evergreen will prepare reports and hold public meetings on Act 2 reports, and we will post information to the website created for the Act 2 process (https://phillyrefinerycleanup.info). Evergreen will make additional notifications before beginning any additional final cleanup activities consistent with future cleanup plans approved by PADEP.

Question:
I would also like to know your plan for holding Sunoco responsible for the decades of destructive pollution they caused in our city. This pollution has had direct impacts on community health in the surrounding neighborhood and has fueled the devastating climate crisis now impacting us all.

Answer:
Sunoco is responsible for cleaning up soil and water contamination generated prior to the sale of the facility in September 2012. Evergreen is managing this cleanup.

Question:
Can you please report how many people are on this meeting as we the public cannot see how many people are here? *(Evergreen note: question refers to the August 27, 2020 Public Information Session)*

Answer:
According to GHD, who administered the meeting on behalf of Evergreen, the raw data indicated an attendance of 493 people. However, after eliminating duplicate logins, attendance by presenters/regulators, and those who connected via both phone and computer, etc., the final count was approximately 213 people. This would not account for multiple people attending via a single computer.

Question:
Will this presentation be uploaded with closed captioning and translated/available in other languages? *(Evergreen note: the question refers to the Aug. 27, 2020, Public Information Session).*

Answer:
In addition to English, Evergreen has posted the presentation and other key documents to the website in three additional languages, Chinese, Vietnamese, and Spanish, which are the three next-most commonly spoken languages in the Philadelphia region. We also modified the website to include a translation button on each page.

Question:
Isn't there ongoing litigation about that plume by 26th street and whether Sunoco/Hilco/Evergreen is responsible for its source and remediation?

Answer:
Evergreen is not aware of any ongoing litigation involving 26th Street. Evergreen currently manages remediation at the property boundary along 26th Street.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
And for waste that is removed, please spell out which communities that waste will be dumped on, at which facilities, the type of facility, the demographics around that facility, and whether this violates Title VI of the Civil Rights Act

Question:
If you remove contaminated soil, where will you place it so that it is not harming others?

Answer:
Transportation, storage, and disposal (TSD) facilities are regulated by the EPA under RCRA through which guidance on hazardous and non-hazardous waste has been developed. Wastes that may be removed from the former refinery facility could go to various different regulated TSD facilities, which will be determined at the time based on the chemical composition and physical properties (determined by testing prior to removal from the facility). Waste profiles, bills of lading or manifests, and/or disposal certificates are provided as documentation of wastes removed from the site and final destination.

Question:
Who is GHD? And what is their relationship to Evergreen and Sunoco and ET?

Answer:
GHD is one of several environmental consulting firms contracted by Evergreen to work on Sunoco's legacy remediation at the Philadelphia refinery.

Question:
Is there a transparent plan to look for and report on any radioactivity (radon, radon daughters, etc.…), whether it is naturally occurring from underground or otherwise?

Answer:
Radon is a naturally-occurring substance and is not known to be affiliated with refinery operations. Radon or other radioactive substances have not been identified as compounds of concern at the Site based on past operations or investigations; therefore, they have not been included in the remedial investigations.

Question:
What was your process for hiring the local consultants. Was there any review of consultants by residents/public?

Answer:
Evergreen considered several factors in selecting consultants at this site including but not limited to a thorough evaluation of the consultants' past experience at similar sites; for example, have they worked at refineries before and/or have they worked on petroleum sites before.

Question:
How can you tell whose benzene is whose?

Answer:
In general, where there are potentially off-site and/or on-site sources that may explain the presence of benzene, factors such as the respective products used at a site, release history and/or environmental conditions – such as geology and hydrogeology, which govern how those products behave in the subsurface -- may assist in identifying a source. Where different releases on-site may explain the presence of benzene, factors such as when the release occurred, among other factors, may assist.

Question:
With the closing of PES an opportunity to restore wetland habitat to the river shouldn't be overlooked. Wetlands purify water and remove contaminants. They also provide habitat for wildlife. And wildlife habitat with accessibility attracts people and helps expose kids to ecology. With that being said - Parcel AOI-10, the West Yard, is just downstream from Bartram's Gardens and is cutoff from the PES facilities on the eastern banks of the river. While river access for barges or boats may be attractive for the future development, creating habitat along the banks of the river, will not only clean and beautify the area, but could also protect the redevelopment from flooding or water damage.

Answer:
It is Evergreen's understanding that there is no planned development for AOI 10 (West Yard).

Question:
Evergreen and Hilco may have a reasonable and actionable agreement about how the cleanup is divided

between you, but the public has no idea whether there is one. It's illogical for Evergreen to be working on a remediation project, and do an incomplete job on an area because some of the contaminants arrived after PES bought it. Or vice-versa.

Answer:

In 2006, Sunoco voluntarily entered the site into Act 2 and Evergreen, since 2013, has been managing the legacy (pre-sale in 2012) site investigation and remediation. PES/Hilco Redevelopment Partners are separately managing post-sale in 2012 releases. Both Evergreen and Hilco Redevelopment Partners separately report to the PADEP on their respective efforts. Sunoco, PES and PADEP entered into a Consent Order & Agreement (CO&A) in 2012 and an amendment in 2020 setting forth their respective obligations. PADEP consent orders are public information and the CO&A is posted to Evergreen's website.

Question from EPA's contractor SKEO's Aug. 6, 2020, Public Meeting
What questions has Skeo asked to Evergreen? Were the answers received satisfactory? What unanswered questions does Skeo have for Evergreen?

Answer:
Skeo has not asked Evergreen any specific questions about the RIRs. Evergreen has reviewed the Q&A that was part of Skeo's report and has included any questions that were included in Skeo's report that were not subsequently asked to Evergreen, as described in Section 1.0.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
The dates for final completion was originally set for December 31, 2020 but was extended for 10 years to December 31, 2030. Why?

Question:
In reference to the deadline, why ten years instead of 3 to 4 years for example?

Answer:
The extension to the cleanup deadline was agreed by Sunoco and the PADEP in the CO&A amendment in 2020 because of bankruptcy of PES and impending acquisition of the property by Hilco Redevelopment Partners, which included a substantial and material change in the use of the site. Evergreen must coordinate its Act 2 timeline with Hilco Redevelopment Partners' redevelopment timeline, which is expected to be approximately 10 years. The planned future use of the site (including, for example, the locations and construction details of buildings) must be known before generating Cleanup Plans.

Question:
Evergreen should make available on its website all historical reports referenced in Appendix A of the 2004 Current Conditions Report.

Answer:

The 2004 Current Conditions Report is not an Act 2 document, nor are the documents referenced in that report. However, many available documents referenced in Appendix A of the Current Conditions Report are posted on the website for reference.

Question:
Unfortunately, there are a few things that I am concerned with as well, including recycling the debris and where are they going to take it?

Answer:
Evergreen provided this question to Hilco Redevelopment Partners, who provided the following response: Approximately 30,000 tons of Asbestos Containing Material (ACM) will be safely abated and disposed of in close coordination with the City of Philadelphia and other regulatory agencies such as PaDEP, USEPA, OSHA etc. and per all applicable standards and regulations.

Question:
We are also requesting that OSHA inspects the site and provides the community with a detail report ensuring that all OSHA precautions are adhered to.

Answer:
Since Sunoco no longer owns or operates the Site, any OSHA inspections should be coordinated with the new site owner, Hilco Redevelopment Partners.

Question:
What sampling has been done of the water and sediment in the Schuylkill River?

Answer:
There has been no direct sampling conducted by Evergreen in the Schuylkill River. An ecological risk assessment has been completed, which evaluated site conditions in relation to the surface water and sediment in the Schuylkill River. This will be submitted after the RIRs are approved in accordance with the Act 2 requirements. Going forward, the groundwater model, which includes a surface water model that is completed in conjunction with the fate and transport model, will predict potential future impacts to the river. Predictive modeling is generally used in lieu of sampling because the Schuylkill River goes through industrial areas and it becomes difficult to discern what contaminants are present and from what party. Therefore, these water and sediment concentrations are predicted through direct modeling from concentrations found on site.

Question:

Who pays evergreen to do this work?

Answer:

Evergreen is an indirect subsidiary of Energy Transfer. Evergreen is fully capitalized to fund the remediation of the site.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:

Evergreen has a specific charge, which you are pursuing in a professional and rigorous way. But you are still governed by that definition. How can we work together to make that real in this case in Philadelphia? Every violation of EJ involves different agencies acting narrowly and ignoring the big picture as not their job. Please work with us to change that here

Question:

EPA does not define environmental justice – especially when it's long been an agency accused of environmental racism itself. The movement defined it in the 17 Principles of Environmental Justice here: https://protect-us.mimecast.com/s/bruECkRKRRf1E6AC8LqL7 - principle #7 is particularly relevant.

Question:

Here is the EPA definition of Environmental Justice. To the best of my knowledge it has not been revoked. Environmental justice is the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income, with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. EPA has this goal for all communities and persons across this nation. It will be achieved when everyone enjoys the same degree of protection from environmental and health hazards, and equal access to the decision-making process to have a healthy environment in which to live, learn, and work

Answer:
Throughout the remedial investigation phase of our Act 2 requirements, we have continued to involve the public in various ways. We remain committed to finding ways to meaningfully engage the public in future meetings, both in our own public meetings and through participation in Hilco Redevelopment Partners' community meetings. We have not and will not intentionally discriminate against any group of people in our public involvement.

Evergreen's work at this site is overseen by both the EPA and PADEP. We look forward to working alongside these agencies, as well as Hilco Redevelopment Partners and the interested public, as we move forward in the Act 2 remediation process and as Hilco Redevelopment Partners works toward redeveloping the site. This will include additional Evergreen public meetings, participation in Hilco Redevelopment Partners' community meetings, and continually updating our website, www.phillyrefinerycleanup.info. This is where we house all relevant reports, documents, background, and presentations, as well as ways for the public to submit comments and questions, and a full record of all past questions and answers.

The following response was provided by the EPA on Jan. 8, 2021:

Our regional Environmental Justice program, and the national Office of Environmental Justice (OEJ) coordinates the Agency's efforts to integrate environmental justice into all policies, programs, and activities. Our mission is to facilitate the Agency efforts to protect environment and public health in minority, low-income, tribal, and other vulnerable communities by integrating environmental justice in all programs, policies, and activities.

Below is an outline of key information on understanding our position on practicing environmental justice in our communities:

***Environmental justice (EJ)** is the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation and enforcement of environmental laws, regulations, and policies.*

***Fair treatment** means no group of people should bear a disproportionate share of the negative environmental consequences resulting from industrial, governmental, and commercial operations or policies.*

***Meaningful involvement** means: • People have an opportunity to participate in decisions about activities that may affect their environment and/or health; • The public's contribution can influence the regulatory agency's decision; • Community concerns will be considered in the decision-making process; and • Decision makers will seek out and facilitate the involvement of those potentially affected.*

EPA and Environmental Justice

EPA's goal is to provide an environment where all people enjoy the same degree of protection from environmental and health hazards and equal access to the decision-making process to maintain a healthy environment in which to live, learn, and work.

EPA's environmental justice mandate extends to all of the Agency's work, including: • Setting standards • Permitting facilities • Awarding grants • Issuing licenses • Regulations • Reviewing proposed actions by the federal agencies

For more information or additional questions, please contact Reggie Harris, Branch Chief, Communities and Tribes Branch Office of Communities, Tribes and Environmental Assessment at harris.reggie@epa.gov or 215 814-2998.

Also, please refer to this link for more information read the Factsheet about the EPA's Office of Environmental Justice: https://protect-us.mimecast.com/s/sXusC82A22U79jQtn9IDy

---

The following questions are similar, so a combined answer is provided to address these related questions.

Question:

The Site is a Source to a Drinking Water Aquifer.

Question:

Is the water table or the lower aquifer the source of drinking water for anyone?

Answer:
The water table and lower aquifers are not utilized as sources of potable water in proximity to the Site. As a part of the investigations, Evergreen conducted a well search within a one-mile radius of the Site using Pennsylvania's Groundwater Information System (PaGWIS) and PADEP's eMapPA GIS mapping tool. Results of the search, which included field reconnaissance, indicated a low probability for potable water supply wells in the area.

Question:

Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.

Answer:
The RIRs and figures presented during the August 27, 2020, Public Information Session show the known extent of dissolved benzene on- and off-site. Evergreen will be including additional off-site groundwater information in the AOI 9 and AOI 4 RIR Addendums. As addressed in previous comments, no off-site air impacts have been identified from off-site groundwater related to historic environmental impacts that Evergreen is evaluating under Act 2. Evergreen has acknowledged the benzene due to on-site sources and identified that there are other neighboring, contaminated sites that are also contributing to the observed off-site site groundwater impacts.

Question:

Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.

Answer:
Remediation systems are reviewed in the RIRs. The RIRs also all include a qualitative fate and transport discussion, which addresses how conditions have changed over time. It is not expected that Hilco Redevelopment Partners will need to replace any of Evergreen's remediation systems because Hilco Redevelopment Partners and Evergreen are working together to limit disruption to Evergreen's ongoing remediation during Hilco Redevelopment Partners' development activities. Evergreen will be able to finalize and share proposed remedial approaches once we are able to finish the remedial investigations and formulate Cleanup Plans. At that time, Evergreen will propose what (if any) replacements, new systems, and/or elimination of existing systems are appropriate.

The question was also provided to Hilco Redevelopment Partners, who provided the following response: Hilco Redevelopment Partners is responsible for remediation at focused areas of the site where contamination occurred after September 2012. Hilco Redevelopment Partners is evaluating ways to improve remediation activities that are ongoing in some of these areas. As Hilco Redevelopment Partners enters these areas into the Act 2 regulatory process, it will conduct Act 2 public involvement activities related to those specific remediation areas. Hilco Redevelopment Partners has also been conducting separate public outreach to inform the community about its redevelopment plans.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:

PFAS - Fire fighting and training exercises have released PFAS ("forever carcinogens") at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Question:
The PA Dept of Environmental Protection has added Per- and polyfluoroalkyl substances (PFAS) to the recent regulations for contaminants—likely present in refineries, since they are used in firefighting foams. Indeed, other states such as Alaska, Michigan, Colorado, and Wisconsin found PFAS contamination in refineries, and are requiring or undergoing remediation of those sites. The site should be tested for these contaminants and required to address the contamination.

Question:
It is important that public agencies at the state and city level ask more of Evergreen. Basic reporting, as required by state law, is not sufficient for this site. PFAS, for example, are likely highly concentrated here due to firefighting on site. I support the specific reporting measures recommended by the Clean Air Council in Mr. Minott's op ed in The Inquirer this morning (January 13). This would be a big step forward.

Question:
Regarding the F&T model, are PFAS compounds going to be included in the model? A model in 2001 showed that groundwater does flow from beneath the refinery to parts of New Jersey, so we wanted to know if PFAS compounds, especially PFOA, PFOS and PFNA, are going to be sampled and included in the modeling?

Question:
Evergreen fails to include Per- and Polyfluoroalkyl Substances (PFAS) as a constituent of concern, despite a history of catastrophic fires at the refinery.

Question:

1) The Site is a Significant Potential Source of PFAS to the Environment

2) Applicable Guidelines Require PFAS Investigation

3) The PES Site should be required to sample for PFAS using appropriate EPA Method 537 methodologies in shallow and deep groundwater and surface water and soil consistent with EPA and PADEP requirements. The Site has experienced multiple releases of AFFF, a product known to contain PFAS, and the lower aquifer beneath the Site, the Potomac-Raritan-Magothy ("PRM") aquifer system, is a major source of drinking water in New Jersey. **The report prepared by EPA's contractor, Skeo Solutions, Inc., acknowledges that contamination in the lower aquifer could migrate offsite and affect the water supply for parts of New Jersey. EPA's policy, Interim Recommendations to Address Groundwater Contaminated with PFOA and PFOS, sets a preliminary remediation goal of 70 ppt for PFOA and PFOS in groundwater that is a current or potential source of drinking water. The Pennsylvania

Act 2 program uses the EPA PFOA and PFOS Lifetime Drinking Water Health Advisory Level of 70 ppt as the groundwater MSC. New Jersey, where drinking water supplies may be impacted, has established an MCL of 14 ppt for PFOA, 13 ppt for PFOS, and 13 ppt for PFNA.

Answer:
PFAS was not sampled during the remedial investigations as it was not included as a Contaminant of Concern. However, as noted during public meetings, PADEP and Evergreen have had discussions regarding future sampling of these compounds. Evergreen subsequently received a formal request from PADEP to sample remediation system effluents for PFAS compounds. Upon receipt of data, results will be discussed with PADEP.

A portion of one of the questions above notes: The report prepared by EPA's contractor, Skeo Solutions, Inc., acknowledges that contamination in the lower aquifer could migrate off-site and affect the water supply for parts of New Jersey. Skeo's report noted "The refinery's pollution may affect an area of underground water (i.e. an aquifer) used by the state of New Jersey for drinking water". That statement is accurate in that an aquifer exists beneath both the former refinery and parts of New Jersey, and Evergreen has acknowledged impact in the lower aquifer beneath the former refinery. However, it is highly unlikely that contamination sourced at the refinery could migrate into New Jersey. We have also noted that until a chemical fate and transport model can be completed, this cannot be confirmed.

Ownership / History / Infrastructure

Question:
In today's presentation (August 27, 2020 Public Information Session), a summary of the content within RI reports was provided. If source, extent and pathway of contaminants is discovered to have conveyed contaminants beyond the beyond the property boundary which legal entity is currently responsible for impact study costs and remediation costs?"

Answer:
Act 2 requires that the RIR defines the extent of contamination, including beyond the property boundaries. Two of the RIRs were not approved for that reason, which is why they required additional off-site work to further define the full extent of contamination in those areas. Any entity causing a release is responsible for the investigation and remediation of that release.

Question:
Could you explain Evergreen's exact relationship with the refinery?

Answer:
Evergreen is an affiliate of Sunoco (R&M), LLC (formally known as Sunoco, Inc. (R&M), a former operator of the refinery), and both companies are indirect subsidiaries of Energy Transfer L.P. In November 2013, Evergreen was formed to manage Sunoco's legacy environmental cleanup at the Philadelphia Refinery. By legacy, we mean that Sunoco retained responsibility for remediating the subsurface conditions at the refinery that existed on Sept. 8, 2012, when the property was transferred to Philadelphia Energy Solutions.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
Please explain the formal, legal, and/or organization ties that Evergreen has to Sunoco and/or Energy Transfer.

Question:
What is [Evergreen's] relationship with Sunoco present-day?

Answer:
Evergreen is an affiliate of Sunoco (R&M), LLC (formally known as Sunoco, Inc. (R&M), a former operator of the refinery), and both companies are indirect subsidiaries of Energy Transfer L.P. In November 2013, Evergreen was formed to manage Sunoco's legacy environmental cleanup at the Philadelphia Refinery.

Question:
I thought the refinery was to be permanently shut down following the explosion in June of 2019? Will the refinery be permanently shut down?

Answer:
Evergreen is responsible only for the historic (pre-2012) contamination that exists below the surface in

soil and groundwater at the Site. Because of that, our work includes investigating and cleanup of the extent of contamination in the subsurface that existed before the sale of the facility from Sunoco to PES in 2012.

Evergreen understands that Hilco Redevelopment Partners, the current owner, plans to redevelop the site and does not plan to operate the site as a refinery. Hilco Redevelopment Partners' work to decommission and demolish the refinery began in the summer of 2020.

Question:
What other companies are involved in the cleanup, besides Evergreen?

Answer:
Evergreen is responsible to cleanup legacy contamination generated prior to September 2012. Hilco Redevelopment Partners is responsible for cleanup of contamination that relates to the time period since September 2012.

Question:

How is it determined what ground pollution is from 2012 and before…and what is from 2012 to the present?

Answer:
When the facility was sold to PES in 2012, Sunoco had a good understanding of the nature and extent of contamination at the facility. After the sale of the property, if changes in the contaminant profile on-site occurred, or known spills happened, the resulting cleanup became PES' responsibility. In some instances, new contamination co-exists with old contamination, and the responsibility is shared.

Similar to our understanding of LNAPL, multiple lines of data are used to help support our understanding of what's historic and what's more recent. Looking at stable isotope chemistry of different elements like carbon and hydrogen and looking at trends (how contaminant concentrations change through time) are examples of some of the tools that are planned to applied for the Site.

Question:
The logistical infrastructure moves petrochemicals across the site. Where are the pipelines, pumps, storage tanks, and intakes/offtakes located (on a map)? What dangers do each pose?

Answer:
The features related to petroleum operations that were included in Evergreen's Act 2 or Chapter 245(Tank Act) investigations are included in the figures in the RIRs, and the associated environmental impacts are summarized in these reports. Also note that operations have been shut down and we expect that most infrastructure will likely be removed as part of the redevelopment.

Question:
The site contains two refineries (at Point Breeze and Girard Point). What is the story for each refinery?

Answer:
While the question is a bit open-ended and capable of multiple interpretations, we interpret this question to be generally inquiring about the ownership history of the two refineries. As specified on the website, Point Breeze (which includes AOIs 1, 2, 3 4, and 8) was formerly owned by Atlantic Richfield Company (ARCO) and purchased by Atlantic Refining & Marketing Company in 1985 and Sunoco subsequently purchased Atlantic in 1988. Girard Point (which includes AOIs 5, 6 and 7) was formerly owned by Chevron and was purchased by Sunoco in 1994. In 2012, the complex was transferred from Atlantic (as to Point Breeze) and Sunoco (as to Girard Point) to PES.

Question:
The site contains multiple tank farms (Schuylkill, etc.). What is the story for each tank farm?

Answer:
While the question is a bit open-ended, we interpret this question to be generally inquiring about Sunoco's regulatory compliance with respect to tanks at the property. The environmental impacts at the tank farms have been evaluated two different ways as part of Evergreen's activities. If there was a release or tank closure from a tank operated by Sunoco, an investigation was completed and reported following the Pennsylvania Tank Act regulations. The general areas of the tank farms were also evaluated following the Act 2 process. Many tank investigations are also included in the RIR documents. Tank closures and releases occurring after 2012 were addressed by the current owner/operator.

Public Participation

Question:
Please listen to the people who have no interests other than the health of their loved ones. Please understand that people are not exaggerating that generations have been suffering from the toxicity of the previous oil refinery's existence, and do not belittle their concerns. Everything is fixable, the question is who will you choose to represent, the people and their health or corporate levers of power? I hope it's not the latter. Clean this area up THOROUGHLY.

Answer:
Evergreen's role here is very specific as it relates to environmental remediation of subsurface contamination at the former refinery site through 2012, when Sunoco sold the refinery, as required by Act 2. We are following all appropriate regulations to carry out this remediation work, including attempting to engage the public throughout the process. However, Evergreen has recently engaged a Community Engagement Consultant to assist us in developing an outreach and engagement plan with the community to further develop our outreach efforts including communication with community members on their concerns and interests.

Question:
Public Participation that begins after the all the information is gathered, everything decided and recommendations are ready to be presented to the public is not adequate public participation. Public participation must begin at the beginning, not the end or near the end.

Answer:
Sunoco submitted a public notice at the time of the Notice of Intent to Remediate (NIR) that started the Act 2 process, and similarly when the NIR was updated two times afterwards. In addition, Sunoco/Evergreen completed public notice when each of the 21 Act 2 reports were submitted to the PADEP. Evergreen also held a public meeting in 2006, during the early stages of the Act 2 activities at the Site, and remains committed to continuing public participation as part of the public involvement plan. This has included and will continue to include additional public meetings.

Question:
Thank you for doing your best to use plain language and take the measures you have to try to include the public, as is required by Act 2. Will you hold more regular small group sessions, as a necessary precursor to the public being able to submit educated comments? Information only presented in a one-way format does not enable true public engagement.

Answer:
Evergreen has offered to community groups, such as Philly Thrive, to meet in smaller group settings to answer questions concerning the Site. Evergreen will work with the community to develop the best format to engage in smaller group settings as part of the Act 2 process.

Question:
Why was there no meeting 11/7/20. Why was Evergreen "blocked" from the meeting? Was there a meeting at all?

Answer:
Evergreen is unaware of the exact reason the meeting was blocked by certain members of the public. The purpose of that meeting was to initiate public involvement by introducing who Evergreen is, provide a summary of the work that has been completed at the site to date, and discuss Evergreen's future activities. Evergreen ultimately held a virtual meeting on August 27, 2020, for the same purpose.

Question:
Does Evergreen consider the 11/7 "event" a formal meeting, and if so, does this start the timeline for them? If it does not, when will the next meeting be held?

Answer:
Evergreen was disappointed that entrances were blocked at the planned meeting on November 7, 2019, preventing members of the community and agency officials from engaging in a discussion about the environmental condition of the refinery property. Evergreen views the public engagement process for the site as ongoing, as comments and questions from the public have been collected since the attempted meeting which involve future activities. Note that since this question was initially asked, Evergreen has hosted Public Information Sessions on August 27, 2020, and January 14, 2020. Another session is planned for March 31, 2021.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
Why did it take 10+ years, and an almost-catastrophic explosion, for Evergreen to come back and engage the public?

Question:
Why was Evergreen so delinquent in doing the outreach associated with the legal/contracted obligations to this site? Until the massive explosion, the community at large had not heard from them in years and their outreach/engagement was pitiful.

Answer:
The June 2019 fire at the PES facility does not relate to Evergreen's Act 2 submittals or public involvement plan.

Since Atlantic/Sunoco purchased the refinery, there have been 21 Act 2 reports submitted and, at the time of each submission (as well as at the time of each of three NIRs submitted for the property), a letter was sent to the City of Philadelphia and notices appeared in a local newspaper informing the public of each submittal and their opportunity to comment on the submittals. In August 2018, PADEP requested that Evergreen revisit the previous public involvement plan with the City of Philadelphia. After a meeting with PADEP, EPA and City officials in November 2018, Evergreen began developing the www.phillyrefinerycleanup.info website in preparation for a public meeting. The fire at PES' facility

occurred after this effort was underway, in June of 2019. At that time, Evergreen suggested opening the website prior to announcing a date for a legacy remediation public meeting to allow the agencies to share the website to aid in answering questions that were being posed about Sunoco's legacy remediation program.

Question:
Many of the finalized online reports reflect reviews done between 2011 to 2016 with no updates. How can I learn what happened next? Is there a person to contact with specific, referenced questions, which would be onerous for a Zoom conference?

Answer:
RIRs do not get updated once approved. Once RIRs are completed and approved, other reports are submitted with additional information, activities, and updates in the Act 2 process. Evergreen has multiple reports planned for 2021 and will provide a draft schedule on the website of upcoming reports. We have also provided copies of the semi-annual update reports on the website, which are not Act 2 submittals, but provide a routine update on remediation activities at the facility. The public can ask questions in writing via email, mail correspondence to our PO Box, or ask them live during meetings. In addition, Evergreen is currently planning smaller group meetings in the future which may make communication easier.

Question:
Tonight's Information Session *(Evergreen note: refers to the August 27, 2020 Public Information Session)* offers a strong basic primer on geology, groundwater and characterization of the contamination readings, and the presenters are very good at explaining things. Many engaged community members have already studied this material together, and with a variety of other subject matter experts, and are ready to move on to learning more about the key decisions being made now (or soon) about contamination management and clean up. Similarly, at the recent meeting held by SKEO and EPA, representatives were resistant to answering public questions beyond the scope of the TASC report. Limiting what information will be given to the public to arbitrarily defined packages does not support meaningful engagement or transparency as defined by the law. I agree with other suggestions that Evergreen and others focus future discussion on critical paths for decision making about management of risks to adjacent communities and the ecological future of the site. As this meeting approaches its end, will you commit to a part 2 of this meeting, soon, to discuss decision making?

Answer:

PADEP requested Evergreen to re-open the comment period for previously submitted Act 2 reports and provide a venue where the information contained in those reports would be presented to the public. This was also echoed by the request from the City to begin and end the comment period with meetings about those previously submitted Act 2 reports.

Therefore, the January 14, 2021 meeting included an open Q&A session to mark the end of the comment period for past characterization reports (where geology/hydrogeology, and characterization are the key elements). Past comments from members of the community also requested that Evergreen provide more explanation about the content of the RIRs.

Evergreen agrees that future meetings should be utilized to discuss future activities at the site. Forthcoming reports are planned for future Act 2 phases – contaminant fate and transport, human health and ecological risk assessments, and site cleanup - which will each have its own comment period and small group meetings to discuss these and other community-requested topics.

With that said, the proposed reporting cannot proceed without first having completed the additional public review process for the remedial investigations.

Question:
Thanks for being open to a community advisory group. This would be a big step forward. It would be very good to schedule a meeting of the advisory group + other stakeholder representatives in the near future to begin to discuss and compare all of the available remediation and capping methods in terms of cost and benefit, and to outline when and how choices will be made.

Answer:
Evergreen is open to discussing these topics with the public and is currently evaluating the most effective method of communication and engagement with all community members. Evergreen cannot proceed through the Act 2 process (including Cleanup Plans) until the public comment process for the approved RIRs and forthcoming addendums is completed; therefore, remedial approaches can be discussed only in general terms since completion of the remaining Act 2 phases is needed to have a more detailed discussion on these topics.

Question:
A presentation where more than 3/4 of the time is spent in a one-way flow of information and where residents' concerns are relegated to a still-diminishing-and-to-be-seen Q & A period at the end of the meeting does not bode well for a process that is inclusive of the public, as the City has requested and as the law requires. (Evergreen note: this comment refers to the Aug. 27, 2020 event).

Answer:
The first public information session held on August 27, 2020, was designed to provide an overview of the technical information in the RIRs. It included discussion of questions and comments already received from the public, both on the reports and the Act 2 process in general. Evergreen is aware that the presentation went long and apologizes for any inconvenience, but intended to work in as many issues that were received from the community while also meeting all PADEP and City requirements for review of the information contained within the reports submitted to date.

Based on feedback received from the public such as this comment, and because the January 14, 2021 meeting was held to close the comment period that was kicked off by August 2020 meeting, the information session held in January included mostly time for Q&A with a short introduction in the beginning. Future public meetings and other outreach efforts will include additional opportunities for open dialog with the communities during the meetings.

Question:
The information on your website seems to be outdated but I recently received a letter in the mail asking

us to submit comments. I worry about our community over the river in South Philly who have dealt with countless decades of health problems due to this harmful refinery. Please keep me updated on this matter.

Answer:
We appreciate that you have taken the time to look at the Evergreen website. The intent of the website is to be a central location that contains all of the most recent reports for the site, a summary of frequently asked questions, and news about upcoming events. We are currently updating the website with information on an upcoming public information session. The postcard was part of Evergreen's overall outreach plan to the community and we welcome any comments you have on the Site and the proposed cleanup process.

Question:
Evergreen has not sufficiently answered questions from the public on its Q&A Webpage.

Answer:
Evergreen is continually reviewing the Q&A to determine what updates are needed to be included in the Public Comment RIR. The Q&A webpage will be updated as any answers are updated as part of this process. Also note that some questions/comments cannot be addressed fully, as the subject matter may be part of future site activities and/or future Act 2 processes.

The following questions are similar, so a combined answer is provided to address these related questions.

As a community resident I think this media forum is not consumer friendly in allowing community members to have an opportunity to participate fully in this report out process. *(Evergreen Note: comment refers to the use of Microsoft Teams Live event during the August 27, 2020 Public Information Session)*

Many communities and cities are finding that COVID 19 doesn't have to stifle public debate. The South Philadelphia and Grays Ferry communities are comfortable with virtual tools that allow us to see and hear each other, as well as Evergreen. It is important that you adopt tools (which you likely use in your daily meetings with colleagues) that promote a true virtual public meeting. Would Evergreen be willing to discuss with community organizations the selection of technology that is more appropriate for virtual public meetings?

Answer:
The Microsoft Teams Live format was selected to ensure that as many people as possible could see the presentation and participate. Other meeting platforms, like Zoom, have caps on attendance, and we knew that there was potentially a significant interest in the first meeting. We chose a platform that had a higher capacity to allow as many people as possible to attend and view the information.

We also chose this specific Q&A format to allow for as many questions as possible to be asked. Taking verbal questions following our presentation would have limited the total number of questions taken.

While many of us use virtual platforms for small group meetings, this type of large group event (the August 27, 2020 event had well over 100 attendees) is not typical for us. As we have all likely experienced, even in small groups there can be issues with background noise and interruptions. We are open to suggestions on ways to improve future meetings in a way that maximizes the opportunity for participation. We also hope that we don't need to do virtual meetings much longer!

With all of that said, we shifted the format of the January 14, 2021, meeting slightly. We utilized the Zoom Webinar platform, to allow for administrators to open microphones individually for those that chose to state questions verbally. We also used the chat function to collect written questions. The intent for this was to allow open dialog while still answering as many questions as possible.

The following questions are similar, so a combined answer is provided to address these related questions.

This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced. Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found. The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean-up, throughout the development of the reports and the clean-up itself.

If residents are going to invest time & energy in providing our comments, we need to know that there will be responsiveness to the comments- and they won't just sit on a website (thank u for the website btw!). Specifically: can "approved" reports that didn't have public input until now be reopened and revised based on public comments that find any inadequacies in the reports? Otherwise what is the point of us commenting?

Answer:
Evergreen is in the process of receiving questions from the public concerning the approved RIRs. We will revise these reports if we find new information concerning the conclusions. The comments received during this phase will also inform the future Act 2 phases, which have yet to occur at the site. These include the Fate and Transport, Risk Assessment, and Cleanup Plan phases.

Note that the question "This process needs to change…" was also forwarded to PADEP for response. PADEP's response was:

"You are correct that public participation should occur throughout the Act 2 process and not after reports have already been approved. Unfortunately, there was a lapse in the administration of the public involvement requirements for this project, and this is the reason the previously approved reports were "reopened" for 120 days to provide for public comment now. Based on the comments submitted, additional environmental work may be required, and the reports may need to be revised. At a minimum, Act 2 requires public access to documents, a public meeting, opportunities for public comment, and responses to those comments from the remediator. Two-way communications (submittal of questions, concerns, and suggestions by the public and responses to those comments by the remediator) is central to public involvement. Act 2 does not mandate, nor does it enable PADEP to require, additional public involvement actions. However, because of the size, duration, and complexity of the Philadelphia Refinery

cleanup project, Evergreen has agreed to implement several other community involvement measures. They are also planning small group meetings which would allow for two-way consultation between Evergreen and the community. The public involvement activities must continue for the entirely of the Act 2 process.

PADEP has also provided input on their guidance with respect to the public's role in Act 2 reports as provided here: *"Act 2 and our regulations and guidance describe several measures "to involve the public in the development and review" of reports, some of which are required. The intent of these measures is to collect comments, suggestions, concerns, and questions on the Act 2 work. The remediator's responses to this input may result in revisions to the report, and in this manner the public influences the development of the report. The public is not just on the receiving end, but it's correct that the primary public role is to comment on the work being done. Those comments can impact both the remediator's actions and also PADEP's technical review and decision to approve the report."*

The following questions are similar, so a combined answer is provided to address these related questions.

Question:

I support the demands of Philly Thrive and all fence line community members. Beyond presenting your goals to the community, it is the right of the community to demand and expect free, prior, and informed consent over the entire process given the health impacts of the air, water, soil, and aesthetics of their community.

This process is one-sided and not meaningfully engaging the public. To follow through on your stated commitment to hear residents about how to make meetings better, listen to our feedback that we've repeatedly shared tonight to create public meetings in a small group format that allow the public to meaningfully share OUR insights with Evergreen and create a community-based advisory group to solicit questions and comments, and continually evaluate the effectiveness of the PIP.

This is a once in a hundred-year opportunity to do right by the people who live by the site. People are eager to be involved and engaged. Will Evergreen consider a process that is less hierarchical? There are limitations due to COVID but past efforts at engagement indicate that communication is one-way rather than a dialogue. Will you make room for smaller, topic-targeted conversation in real-time rather than this type of Q+A?

Question:

The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean-up, throughout the development of the reports and the clean-up itself.

Question:

The people affected by what Evergreen and Hilco are doing need to be involved. Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-

based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis.

Question:

As a Grays Ferry resident, I'm very concerned about the clean-up and the lack of community involvement in the process as well as minimal communication with the community as to the health hazards and potential risks. There needs to be meaningful inclusion of community members throughout the Act 2 process, which means open access to information, feedback, and frequent consultation. This can be accomplished by creating a community-based advisory group to solicit questions and comments and evaluate the effectiveness of the PIP on an ongoing basis. None of the work that's been done so far has involved active outreach to ALL community members.

Question:

For years have been told what was happening only to find out it was not true we need to create a community base Advisory to review everything that's going on are you willing to do that.

Answer:
Evergreen understands the community's interest in the site and is committed to providing meaningful public involvement. Evergreen has reached out in many ways, beyond Act 2 requirements, to work with the public and identify the best and most productive ways to engage. Evergreen has already taken several actions to involve the public in meaningful ways as bulleted below. In addition to the items listed below, Evergreen plans to expand outreach/communication efforts throughout future Act 2 phases and reports, and is currently engaging with the community in small groups to garner additional input on the best methods for future communication and engagement activities. Future meetings are already planned with the goal of discussing topics that are of particular interest to the public based on receipt of comments/questions to date. This may include the public involvement process, climate change, lower aquifer conditions, contaminant transport, site cleanup, etc. All of these activities are part of the development of an advisory process that is planned to be discussed in more detail during the March 31, 2021 public meeting.

Below are some examples of recent public engagement activities conducted by Evergreen:

- **Comprehensive Website**

Evergreen created a website for the Philly Refinery remediation program, which offers full public access to the completed Act 2 reports, the PADEP comments to these reports, and supporting information and background. The reports have been posted on this site since it was opened in July 2019 and we have continued to supplement with additional background and presentations. The website also includes an area for the public to directly submit comments and questions; a full record of past questions and comments, along with Evergreen's responses; the dates and logistics of upcoming events, including public meetings, report submittals, etc.; and email and U.S. mail addresses opened solely to accept public questions and comments. This website will be updated continually and will provide an information hub for the public to access information about Evergreen's activities at the facility.

- **Hard Copy Mailer**

Evergreen sent a hard copy mailer to all known addresses of residents and businesses within approximately one mile of the site in June 2020 to notify the public about Evergreen's investigation and

remediation activities, the availability of documents for public review, and the opportunity to ask questions and engage in dialogue with Evergreen.

• Meetings with Community Groups

Evergreen has met with Philly Thrive on a number of occasions since the initial meeting attempt in November 2019. Philly Thrive members have provided insight into the community and Evergreen will continue to reach out to Philly Thrive and other local groups in an effort to reach other interested stakeholders.

• Participation in Existing Community Advisory Panel

Evergreen will be available to discuss any legacy remediation activities with the existing Community Advisory Panel (CAP), which was initially created for the site by Sunoco to provide updates on environmental matters to the public. PES continued this CAP, and Evergreen provided PES with updates on remediation progress for use during the CAP meetings. Hilco Redevelopment Partners has also continued this CAP, which serves as an open forum for discussion with community stakeholders.

• Plain Language Summaries

Due to the technical nature of the Act 2 process, the reports include a lot of technical terms, concepts, and acronyms. Evergreen has created plain-language summaries for the Act 2 reports, as well as a plain-language summary to assist in the public's review of these documents. Evergreen will continue to include plain-language summaries along with all future Act 2 submittals.

• Translation of Documents

Evergreen has provided translations of the plain-language summaries as well as the presentation given during the August 27, 2020 Public Information Session into Chinese, Spanish and Vietnamese, since these represent the next three most common languages spoken by community members surrounding the former Philadelphia Refinery (in addition to English).

• Local Library Access

Act 2 reports are also available at two local library branches, noted on the website, along with all other Act 2 documents. All future reports will be added to the library as well.

• Public Information Sessions

Evergreen hosted a virtual Public Information Session on August 27, 2020 to provide the public with an overview of the investigation and remediation program to date at the facility. This meeting provided a summary of all Act 2 reports submitted since the site entered the Act 2 program in 2006. This meeting marked the beginning of an additional 120-day review period for each report, as each report had a public notice and comment period at the time of their submittal and before their review by the PADEP. The end of the review period was marked with a second meeting on January 28, 2021 where commonly asked questions were reviewed, and an open question and answer period was conducted.

• Email Blasts

Evergreen has worked with the City of Philadelphia, regulators, and community leaders to create an email distribution list for individuals, civic groups and local businesses who may be interested in the Act 2 process at the site. Any person submitting a question or comment is added to this list for future

communication. Email notifications have been, and will continue to be, sent to this distribution list in advance of public meetings and report submittals. People receiving these notifications are encouraged to share them with others who may also be interested in the process.

Question:

We are listening to your description of evergreen communications, but after exploring the materials at length, and attending meetings, many engaged citizens don't agree that you are offering access to materials that facilitate public conversations, delivering 1000 page documents for comment is not democratic. Your reports can easily be designed to make key data and decisions accessible to the public. And the question is are you willing to create living documents that are updated about the state of knowledge about contamination and incorporate public comment? This will make for authentic public conversation about the future of this incredibly important place in our city. The recent NYT article about PES and Philly Thrive shows that the world is watching how we do this. Evergreen can be an important leader.

Answer:
The reports Evergreen is required to submit to regulators are inherently long and technical due to their specific requirements as related to the site's history, size, and complexity. Reports must include the incorporation of not just current data, but all historic data, with back-up documentation for all referenced activities and interpretation in the reports. While the reports have always been accessible to the public, Evergreen created the website to make them even more accessible, in addition to developing plain-language summaries and translating them into multiple languages indicative of Philadelphia's demographics, which is not required by Act 2.

While the content and general format of the Act 2 reports themselves remain constant, Evergreen is interested in hearing ideas about other ways to provide digestible information to the public, in addition to the plain-language summaries and visual presentations made available from past public information sessions. Evergreen also plans to create a page on the website for a calendar and project updates to provide more timely updates on Evergreen's site activities, since the time between Act 2 reports is often long.

Question:

Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.

Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.

Answer:
The RIRs have been available at PADEP for the public to review since the time of their submittal. The reports have been posted to Evergreen's website created for the refinery project since July 2019. The 120-day comment period consists of the time between the first Public Information Session on August 27, 2020, and the second Public Information Session In January 2021. This Public Comment RIR includes the

comments and questions received since the attempted meeting in November 2019, including the "120-day" comment period from August to January 2021.

Once this RIR is accepted by the PADEP, Evergreen will then submit the RIR Addendums to address reports that had not been approved by PADEP. These reports outline the nature and extent of contamination; they do not propose a final cleanup plan. The majority of the questions raised by the public concern topics that will be addressed in future reports and activities that cannot take place until remedial investigation is complete.

The required 120-day period, which will have actually been open for 14 months, since notice went out for the planned November 2019 meeting, is only for the RIRs; the public will again have the opportunity to engage Evergreen concerning all future Act 2 phases, including Risk Assessment and Cleanup Plans. These two phases will encompass many of the questions and concerns that the public has provided to date.

Philly Thrive had previously requested removal of the 120-day comment period in August 2020, to which Evergreen provided the following responses:

• The 120-day timeframe was agreed to by the City, PADEP and EPA.

• The CO&A entered between Sunoco and PADEP includes deadlines for remediation progress, requiring that the Remedial Investigation reports be completed in order to move to the next phones of the Act 2 process. Evergreen cannot move forward with the Act 2 cleanup process without finalizing these reports.

• The previously submitted reports have been available for public review/comment for over a year and many public comments have already been received and addressed. The 120-day period being proposed is an extension of this overall review period.

PADEP offered the following response to Philly Thrive's request as well:

"The duration of the public Comment period isn't defined by Act 2 and DEP does not decide its length. The public involvement plan was created by Evergreen with input from the city. We have had several conversations with these parties and EPA concerning the public comment period, and we also participated in meetings with Thrive on this topic (in December 2019 and May 2020). We understand that city representatives are satisfied with the 120-day period. PADEP considers 120-days to be appropriate considering that Act 2 documents have been available online since July 2019 and Evergreen has been accepting public comments snice November 2019."

Regulations

Question:
Have you submitted draft cleanup plans to DEP? Can we receive a copy of the Cleanup Plan?

Answer:
A draft Cleanup Plan has not been submitted to the PADEP. Remedial investigations must be completed prior to submitting Cleanup Plans and other Act 2 reports that follow remedial investigations in the Act 2 process. Upon completion of RIRs for each of the AOIs, the subsequent Act 2 reports can then be submitted. The Cleanup Plan(s) will be prepared and submitted following the Sitewide Fate & Transport RIR, Sitewide Ecological Risk Assessment Report and any Human Health Risk Assessments completed for the Site. However, remediation (cleanup) activities which were conducted prior to entering the Act 2 program and interim remediation activities currently being conducted are summarized in the RIRs posted to the website.

Question:
I understand that the cleanup is happening under a voluntary act 2 opt in? What were the benefits to opting into this program?

Answer:
The information provided below was largely obtained from the PADEP Overview of the Land Recycling Program Fact Sheet, which can be accessed through this link: DEP Fact Sheet.

The Land Recycling Program (which actually includes Acts 2, 3, 4, 6 and 68, but is commonly referred to as "Act 2") encourages the recycling and redevelopment of old industrial sites, such as the PES Refinery. It sets standards, by law, that are protective of human health and the environment and that consider future use. It provides potential developers with clear cleanup standards based on risk, not a moving target in a negotiated agreement, and provides an end to liability when that cleanup standard is met. This makes old industrial sites more attractive to potential developers. As a result, many sites have been and will be redeveloped with Act 2, helping many of the Commonwealth's urban and rural municipalities to provide jobs and economic growth while remediating environmental impacts, ensuring protection of human health and the environment.

Some additional advantages of using Act 2 for the cleanup of the site include:

Uniform cleanup standards – Act 2 establishes environmental remediation standards to provide a uniform framework for cleanups. The standards established under Act 2 are used for most voluntary and mandatory cleanups conducted in Pennsylvania.

Standardized review procedures – Act 2 describes the submission and review procedures used at sites, thus providing a uniform process for all sites statewide. Uniformity makes it easier to prepare submissions and follow through the steps necessary to remediate a site, which also provides more transparency to the public in the process. It also establishes timeframes in which regulators must complete review of submissions.

State releases from liability – Act 2 provides owners or developers with releases from state liability for a site that has been remediated, according to the standards and procedures in the Act. Act 3 extends

liability protection to financiers, such as economic development agencies, lenders, and fiduciaries (fiduciaries are those who act as a trustee, executor, or administrator for the benefit of another person). These provisions are intended to reduce the liability concerns that may inhibit involvement with/cleanup of contaminated sites.

Memorandum of Agreement with EPA – In April 2004, PADEP and EPA entered into a Memorandum of Agreement (MOA) that clarifies how sites remediated under Pennsylvania's brownfields program also may satisfy requirements for three key federal laws: the RCRA, the Comprehensive Environmental Response Compensation Liability Act (CERCLA), and the Toxic Substances Control Act (TSCA). The framework outlined in the MOA provides procedures for coordinating cleanups under Act 2 with federal cleanup requirements under RCRA, CERCLA, and TSCA, where applicable. Specifically, the MOA allows for Act 2 to address the cleanup of the PES Refinery not only in relation to historic releases and tank closure (under the Pennsylvania Tank Program), but it also provides for the closure of EPA's concerns (under the RCRA program), which will result in a more comprehensive site cleanup. In 2011, the facility was entered into the One Cleanup Program.

Question:
Is your remediation process (Act Two and beyond) guided in accordance with the Environmental Rights Amendment (ERA), (Article I, Section 27 of the Pennsylvania Constitution), which states:

"The people have a right to clean air, pure water, and to the preservation of the natural, scenic, historic and esthetic values of the environment. Pennsylvania's public natural resources are the common property of all the people, including generations yet to come. As trustee of these resources, the Commonwealth shall conserve and maintain them for the benefit of all the people."

Answer:
Section 101 of the Land Recycling and Environmental Remediation Standards Act, which established Act 2, specifically includes language about how Act 2 helps to achieve the objectives of Article I, Section 27 of the Pennsylvania Constitution. The future cleanup activities of the Site will be completed in accordance with the Act 2 program requirements, also supporting these goals.

Question:
In today's presentation, related to lead, the presenter described that 'it is a complex process' for 'choosing the standard' associated with lead contamination levels and its subsequent categorization. Why does the entity responsible for contamination clean-up (and their supporting team) have the option to choose their standard for clean-up? Who is the authority having jurisdiction who reviews the selected standard? Are other standards more stringent? If so, why were those standards not used for these contaminants in this case?

Answer:
There are three choices for cleanup standards that can be applied to any Act 2 site: statewide health, background, or site-specific. The choice between the three standards is up to the remediator, but each one has strict guidelines and processes that must be followed to demonstrate to the PADEP (who has jurisdiction and responsibility to review the selected standard) that the standard is appropriate and has

been met. PADEP has also provided some information that is helpful in answering this question - please see the PADEP response below to the question "How do DEP and Evergreen determine what is safe?"

Question:
How do DEP and Evergreen determine what is safe?

Answer:
This question was sent to PADEP who provided the following response:

PADEP establishes Act 2 statewide health standard cleanup values for soil and groundwater, known as MSCs, using a variety of risk- and health-based methods. For instance, many groundwater MSCs are adopted from EPA's drinking water standards. Other MSCs are calculated by PADEP to protect human health at acceptable risk levels (e.g., a cancer risk of no more than 1 in 100,000).

For site-specific standard cleanups, remediators may develop a risk assessment that uses data specific to the site, and therefore it may differ from attainment of the statewide health standard MSCs. Risk assessments must demonstrate acceptable cumulative risks, meaning that health effects of all contaminants from both soil and groundwater and through all exposure pathways must be examined. Risk assessments must also consider all potential human receptors (e.g., workers and contractors, as well as nearby residents if contamination has migrated to homes, parks, etc.).

An alternative approach with the site-specific standard is known as "pathway elimination," meaning that the remediator implements measures to prevent people from being exposed to contamination. These measures commonly include constructing a cap at the surface so people won't touch or ingest contaminated soil and dust, prohibiting groundwater use, and sometimes installing systems to mitigate vapor intrusion in buildings. The determination that pathway elimination remedies are "safe" relies in part on the remediator following best practices and standard guidance. PADEP reviews plans and specifications for the work (submitted in an Act 2 cleanup plan), PADEP reviews documentation for the remedy completion (submitted in an Act 2 final report), and PADEP inspects the installation work and subsequent maintenance of the remedy. In addition, PADEP oversees the execution of an environmental covenant recorded on the property deed to ensure future maintenance of the remedies. In some cases, testing is also performed to verify that the remedy is effective.

Lastly, while the focus of Act 2 cleanups is on the protection of human health, they must also address potential ecological exposures. Contamination that affects certain sensitive ecological receptors, such as threatened and endangered species, must be addressed in the cleanup. This can also be accomplished through a risk assessment or remedial measures.

Question:
Are you aware which Philadelphia City officials are charged with reviewing the documents?

Answer:
Evergreen is not aware of who at the City may review the Act 2 reports. Our Act 2 reports must be reviewed by both PADEP and EPA for approval, not the City. Nonetheless, the City is engaged in the public involvement process.

Question:
But the state of PA actually uses a blood lead level double what the federal CDC updated in 2012.https://www.cdc.gov/nceh/lead/data/blood-lead-reference-value.htm

Answer:
Response provided by PADEP and posted on Dec. 28, 2020:

DEP's published statewide health standard non-residential direct contact numeric value for lead in soil, 1000 mg/kg (milligrams lead per kilogram soil), was based on a target blood lead level in adults of 20 <U+F06D>g/dL (micrograms lead per deciliter of blood). Evergreen derived a site-specific direct contact numeric value in their 2015 risk assessment based on a target blood lead level of 10 <U+F06D>g/dL. This is U.S. EPA's default value in the Adult Lead Methodology, which was the method used by Evergreen in their risk assessment calculation.

Remediation

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
When will the community be notified in south and southwest Philly about the clean-up?

Question:
I am wondering if you are able to send out updates about what plans are being carried out when. For instance, if you are cleaning a particular thing, I'd like to know ahead of time when that cleaning will take place and what the risks to the surrounding environment/people are.

Answer:

Evergreen is in the process of finishing the investigation activities at the former Philadelphia Refinery to identify the extent of the chemicals in soil and groundwater, in order to ultimately develop remediation (cleanup) plans for the site. During this process, Evergreen will develop reports and hold public meetings, both of which will have public notices. Throughout the process, we will post information to the website created for the Act 2 process (https://phillyrefinerycleanup.info). Evergreen will make additional notifications before beginning any final cleanup activities.

Question:
Hilco has indicated in the Soil Management Report it filed with the City that the site-specific standard for lead required for the HRP intended uses for the site is 1,000 PPM. Will Evergreen remediate to this 1,000 PPM standard rather than the 2,240 PPM previously approved by PADEP?

Answer:
Evergreen's future Cleanup Plans will still compare all new soil data to both the statewide health and site-specific values to determine appropriate remedy selection. In addition, Evergreen will reevaluate the current site-specific standard based on PADEP's proposed new soil standards and associated input values.

Question:
Have you submitted draft cleanup plans to DEP? Can we receive a copy of the Cleanup Plan?

Answer:
A draft Cleanup Plan has not been submitted to the PADEP. Remedial investigations must be completed prior to submitting Cleanup Plans and other Act 2 reports that follow remedial investigations in the Act 2 process. Upon completion of RIRs for each of the AOIs, the subsequent Act 2 reports can then be submitted. The Cleanup Plan(s) will be prepared and submitted following the Sitewide Fate & Transport RIR, Sitewide Ecological Risk Assessment Report and Sitewide Human Health Risk Assessment Report (or some combination of these reports). However, remediation (cleanup) activities which were conducted prior to entering the Act 2 program and interim remediation activities currently being conducted are summarized in the RIRs posted to the website.

Question:
Have you considered remediating with bacteria? Or mycelium? We understand they're both more affordable options.

Answer:
Evergreen has considered and will continue to consider various remedial options at each area of the site. Remedial options must consider a number of factors, including but not limited to logistics, utilities, subsurface flow conditions, chemistry, nature and extent of the contamination, nutrient availability, etc. Bioremediation technologies, not specifically mycoremediation, have been/are being utilized in AOIs 4 and 1 and will continue to be considered for the Site.

Question:
What is the quality of the water discharged from the Pollock St well system into the Schuylkill?

Answer:
Groundwater collected from the Pollack Street well system is not discharged directly to the Schuylkill River. Groundwater discharged from any remediation system is either processed through the facility's wastewater treatment plant, which operates under a National Pollutant Discharge Elimination System (NPDES) permit held by PES, or discharged to the Philadelphia Water Department (PWD) sewer system via a Groundwater Discharge Permit held by Evergreen. Evergreen samples groundwater discharge to the PWD sewer per the permit requirements and the discharge from the facility's wastewater treatment plant is sampled by PES in accordance with their NPDES permit.

Question:
What is being done to prevent contaminated groundwater from entering the Pollock and 26th St Sewers?

Answer:
Groundwater and LNAPL are being recovered via remediation system recovery wells along the property boundary in an area along 26th Street. Groundwater and LNAPL are also recovered via horizontal recovery wells along the Pollack Street sewer through the facility. Sewer conditions are to be evaluated as part of the future modeling efforts.

Question:
Two water filtration plants (at Girard Point and Point Breeze) treat groundwater before returning water to the Schuylkill River. How effective are these systems? What happens during heavy rains and floods?

Answer:
The water treatment plants are run and operated by PES under a NPDES permit issued by the PADEP. Operation of the water treatment plant will be conducted by the new property owner. PES or the PADEP would be better able to respond to the question of how effective these systems are and what happens during heavy rains and floods.

Question:
Should the groundwater remediation systems that were discontinued be restarted? If not, why not? If so, when will that happen?

Answer:
Various remediation systems have historically been discontinued when the remedial goals are complete or where the technology is no longer the most appropriate. Each remediation system is discussed in its associated RIR. Any proposed additional systems, remedial goals and associated monitoring will be included in future Act 2 reports such as the Cleanup Plan.

Question:
Can you please go over your plan to clean up lead and other toxic contaminants at the site? And your plan to provide a sufficient analysis of and a plan for effectively and safely cleaning up contaminants in the deep aquifer below the site. I urge you to use the strictest possible health-based standard to clean up toxics in both of these and all other cases.

Answer:
All plans for cleaning up contamination in both soil and groundwater will be included in the Act 2 Cleanup Plan(s).

Question:
Can we get some documentation saying that your company has started cleaning any part of this site?

Answer:
Documentation of Evergreen's ongoing and historic remediation activities are included in each of the RIRs.

Question:
Does the remediation process create an odor or smell? What kind? Will it be all the time, or at certain times?

Answer:
Emissions from Evergreen's systems are all treated in some form. Groundwater and LNAPL pumping systems are closed-loop systems from which vapors are extracted from the system components themselves (no vapors are extracted from the subsurface) and are treated with either granular activated carbon or catalytic oxidation. The sewer vapor extraction systems both use biofilter beds to treat air that is removed from the sewers. All systems are permitted by Philadelphia Air Management Services (AMS), who define emission levels that each system must meet. There are no odors observed from these systems' emissions.

Other remediation processes, such as excavation, may create short-term odor simply by disturbing the subsurface and extracting the materials. Engineering controls (e.g. odor/dust suppressants and/or fans) are typically used to minimize the transport of odors off-site during excavation activities.

Question:
When will we get information comparing all the available remediation methods in terms of cost, effectiveness, and community impacts (such as air emissions from the remediation process itself)?

Answer:
Evaluation of current and potential remedial options is ongoing. Evergreen will submit Cleanup Plans upon completion of all remedial investigation activities, which will consist of identification and evaluation of remedial alternatives; selection of proposed remedies; and plans for the development, construction, and initial operation of the proposed remedy and/or documentation of interim remedial actions already in place. Note that remediation to site-specific standards may include treatment, removal, engineering, or institutional controls.

Per Section 304(j) of Act 2, the Cleanup Plans will document the evaluation of criteria such as the effectiveness of the remedy to manage risk, the extent to which the risks are being reduced, the ability to implement the remedy, reduction of regulated substances, post-remediation care plans, and cost-benefit considerations.

Question:
Can you please make the water permits mentioned public?

Answer:
Evergreen currently holds PWD discharge permits. These will be posted to the website.

Question:
What is the timeline for the [remaining] cleanup? Is it measured in months, or years?

Answer:
Evergreen's active remediation has been ongoing for decades and may extend for many years. Part of the future Act 2 Cleanup Plan will include defining parameters that are measured and tracked to determine the appropriate time to cease active remediation in each area.

Question:
What specific steps are being taken to clean the water from potential contaminants?

Answer:
Since the original Consent Order & Agreement between Sunoco and PADEP in 1993, Sunoco and Evergreen have implemented several interim remedial actions at the refinery. Various remediation systems were installed in the facility in 1995 to prevent the migration of impacted groundwater off-site. Additional remediation systems have been installed since that time to either address source removal (removing petroleum product and contaminated groundwater at the source of the release on-site) and/or control the migration of impacted groundwater beyond the property boundary. Between 1993 and the present, twenty-five remediation systems have been operated at the refinery by Sunoco/Evergreen.

Remediation activities have included, but are not limited to groundwater and/or product recovery via both vertical and horizontal wells, where product and/or groundwater impacted with hydrocarbons are removed from the subsurface; oxygen injection into groundwater ,to aid in removal and/or breakdown of petroleum products in the subsurface; sewer ventilation systems, or the removal of petroleum vapors from air in subsurface utilities; and soil vapor extraction, or removing petroleum vapors from the subsurface.

Many of the remediation systems have been decommissioned over the years when they have achieved their intended purpose and/or other remedial alternatives have been selected. Evergreen currently operates nine remediation systems at the site. In addition to remediation systems, areas of soil have been remediated at the facility via excavation and/or capping.

As discussed above, after the Fate and Transport RIR, Human Health Risk Assessment and Ecological Risk Assessments are completed, these interim remedies – along with potential additional remedies – will be evaluated and included in the Act 2 Cleanup Plan.

Question:
How long will this take and when will the cleanup start?

Answer:
The cleanup, when talking about subsurface remediation, has been ongoing for quite some time. The need for any additional remediation systems to address pre-2012 impacts will be detailed in the Cleanup Plan(s). However, some subsurface cleanup activities (soil removal) will occur as Hilco Redevelopment Partners' development occurs. If impacted soils are encountered during site work that cannot remain on-site, they will be excavated and removed for off-site disposal. The timing of that would be coordinated with Hilco Redevelopment Partner' schedule for development of different areas of the site.

Question:
In today's presentation, the presenter described the topic of "source removal" as a remediation approach, summarizing it as "get rid of it." It is understood that this is a plain-word explanation for a more involved process. What percentage of this project is proposed to be source removal, and where is the material to be removed going? What is the line of custody for such removal, at what stage are the applicable permits? Are the byproducts of such processes contaminants themselves, and does the proposal comply with regulations and standards for such byproducts?

Answer:
These are all questions that are generally addressed in an Act 2 Cleanup Plan. The Cleanup Plan(s) will be submitted subsequent to RIRs.

Question:
Conventional land remediation consists of capping the contaminated soil with tarp and/or concrete; or hauling the soil someplace else. Capping ignores the problem for a few decades at most, until chemicals leach out. In this case, into the Delaware River. Hauling the soil elsewhere just pushes the problem of leaching onto another bioregion. Neither of these methods is true remediation since we're either

burning, burying, or relocating the contamination. Eco-remediation is the most cost effective method of remediating soil and water, per figure 98 in "Mycelium Running, Paul Stamets.

Answer:
Evaluation of current and potential remedial options is ongoing. Cleanup Plans will be submitted upon completion of all remedial investigation activities, which will consist of identification and evaluation of remedial alternatives, selection of proposed remedies, and plans for the development, construction, and initial operation of the proposed remedy and/or documentation of interim remedial actions already in place. The Cleanup Plans will document the evaluation of criteria such as the effectiveness of the remedy to manage risk, the extent to which the risks are being reduced, the ability to implement the remedy, reduction of regulated substances, and post-remediation care plans, among other potential factors.

Question:
Remove all of the lead, we deserve a space that is safe to work and play in.

Answer: Act 2 includes procedures to allow for the reuse and redevelopment of a site while maintaining safety of the community, environment, and workers on site. This is inherently the purpose of Act 2. Evergreen will evaluate how best to do this through remediation, pathway elimination, modeling, risk assessment, and engineering and institutional controls to make sure that the workers and people of the community are safe, and to protect the environment.

Question:
To what extent will you be using bioremediation technology?

Answer:
Evergreen is currently using a form of biotechnology at the site for interim remedial activities. We have two biofilters on site, which take the vapors pulled out of the sewers and treat them. Bioremediation technology is not currently used to treat any groundwater. Most systems on site currently are in place to prevent migration of contaminants to receptors such as sewers or property boundaries. Evergreen will evaluate treatment options in future Cleanup Plans.

Question from EPA's contractor SKEO's August 6, 2020, Public Meeting:
What was the impact of the recent hurricane on the ongoing remediation processes? *[Evergreen note: the SKEO Meeting took place in October 2020]* Were any of the water treatment processes overwhelmed and were there any discharges into the River?

Answer:
Evergreen has not observed any impact by heavy storm on our remediation processes at the site. Evergreen is unaware of conditions with facility wastewater treatment plants or discharges, as those are facility operations.

Question from EPA's contractor SKEO's Aug. 6, 2020, Public Meeting:
We are still waiting on a city response to our request for a public hearing on Evergreen's existing remediation infrastructure, including vents that emit fumes coming from underground pollutants.

Answer:

It is our understanding that Philadelphia AMS will hold a public hearing on the draft Natural Minor Operations Permit; however, Evergreen is not aware of the timing. Questions regarding the permit application and timing of future public hearings should be directed to Philadelphia AMS.

Question:

These are very informative graphics (referring to the August 27, 2020, Public Information Session). What about removal of contaminants that are in the soil? Lead cannot be pumped out. All the soil must be removed.

Answer:

Contamination in soil can be addressed in many ways. While some areas of soil impact have been excavated previously, soil remediation can also include institutional and engineering controls, which eliminate a risk by blocking a pathway of exposure. Remedial plans for all media will be detailed in the Cleanup Plan(s).

Question:

In addition to the toxins already mentioned, what is the plan to deal with the benzene that is in the soil?

Answer:

In general, benzene and other volatile compounds are not identified for further evaluation in soils (meaning they were not detected above the statewide health standards in many locations). However, all remedial options, which can include engineering and intuitional controls, will be detailed in future Cleanup Plans.

Question:

Is there a permit for the discharge of water from the wastewater treatment system to the Phila Water Dept? Who is the permittee? Have the permit requirements been met?

Answer:
Evergreen has a permit for discharge from a remediation system directly to the PWD and is not the permittee for the on-site wastewater treatment plant.

Question:
It may have been more effective if this presentation was made available a week ago and we could have spent these two hours asking pertinent questions, such as: 1. what are the critical paths for considering the risks of lead and benzene to the adjacent communities; 2. how are increased climate-change risks being assessed; 3. how is ground and surface water run off being considered in the plans; 4. how is Hilco assessing the additional risks of (what looks like will be) hard scape pavement of 85-90% of the site?

Answer:

1) The route of exposure (or risk pathway) identified for adjacent communities would be potential indoor or outdoor air impacts from dissolved groundwater plumes that migrate offsite. However, initial assessment did not find any potential impacts to off-site residences from the conditions in shallow groundwater. This will be further evaluated after the contaminant fate and transport model is completed. Any issues that require mitigation efforts will be addressed in future Cleanup Plans.
2) Climate change will be considered during the Fate and Transport modeling. This will be presented in the Fate and Transport RIR, as well as in the selection of the remedial approach of the Site, which will be presented in the Cleanup Plan.
3) Ground and surface water runoff will be evaluated as part of the remedial approach, presented in the Cleanup Plans.
4) Questions regarding Hilco Redevelopment Partners' plans should be directed to them.

Question:
If there are risks to people I would like to be provided with information which will allow me to identify if something in your process has gone poorly and if I need to take further precaution to keep myself and my family safe.

Answer:
Evergreen interprets this question as potentially being in reference to the ongoing demolition and construction processes, which would be the responsibility of the new property owner. However, with respect to Evergreen's responsibility to investigate and remediate soil and groundwater contamination, the route of exposure to nearby communities would be potential indoor or outdoor air impacts from dissolved groundwater contamination that moves offsite in some areas. However, our initial assessment did not find any potential impacts to off-site residences from the conditions in shallow groundwater. This will be further evaluated in the future and any issues that require mitigation efforts will be addressed in future Cleanup Plans. Evergreen is also currently developing better processes for communicating important information about our remediation program to community members.

Question:
What are some of the possible risk pathways that you've encountered at the refinery. And how are you dealing with them?

Answer:
Risk pathways include routes of exposure for contaminants to reach receptors. One potential pathway would be vapor migration into sewers or buildings. Vapor intrusion into buildings can be addressed

through various engineering controls, such as positive pressure in a building or vapor barriers/mitigation systems. Potential sewer vapors are currently being controlled in multiple locations using remediation systems that extract air from the sewers. Another potential risk pathway is direct contact with impacted soils, which can be controlled by eliminating the pathway via capping or use of personal protective equipment/safety standards. All potential exposure scenarios and proposed mitigation measures will be detailed in future Cleanup Plans.

Question:
The speaker (during the August 27, 2020 Public Information Session) said that the remedial investigation reports have to be approved before Evergreen does risk assessments. Since this hasn't happened yet, why did Evergreen already complete the risk assessment for lead in soil?

Answer:
In order to determine risk to human or ecological receptors associated with contamination in soil or groundwater, the extent of the contamination must be known/defined for accurate calculation of risk. The calculation of the lead site-specific standard for shallow soil used risk-based calculations utilizing the updated adult lead model and exposure assumptions recommended by the EPA and the PADEP. This approach was appropriate since the extent of lead in soil had been defined. The two RIRs that were not approved were due to the need for additional wells to better define off-site migration of groundwater plumes, not lead in soil.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
I'm worried about Hydrofluoric acid or HF because if it gets into the neighborhood and someone throws a cigarette and it hits it, the whole neighborhood will blow up causing massive casualties.

Question:
Another concern I have is about Butane because this is the second large chemical in there this is lighter fluid and if it's the right pressure and temperature then this will blow up also, this was the gas that blow up in the first place and if this was in a neighborhood it would be like a nuclear bomb exploded.

Question:
Another concern I have is about nickel carbonyl because nickel carbonyl is very toxic and can cause chronic bronchitis, reduced lung function, and lung and nasal cancer if breathed in.

Answer:
These comments refer to chemicals used in petroleum refining processes and concerns with potential gas phase/ambient air conditions. Evergreen cannot address concerns regarding use of these chemicals, as Evergreen is responsible solely for contamination in the subsurface and from releases prior to 2012.

Question:
Of particular concern are impacts to living species in the Schuylkill and Delaware Rivers: - Persisting

water quality problems stemming from site pollution (including sedimentation) that enters surface water through stormwater runoff and other pathways. These problems include low Dissolved Oxygen that impinges on fish and other aquatic life, hydrocarbons such as benzene and polychlorinated biphenyls (PCBs), along with other legacy pollutants that harm species and their habitats - Endangered species (i.e., Atlantic Sturgeon and Shortnose Sturgeon, both of which are federally endangered); both of these sturgeon species are greatly imperiled and use this part of the tidal Schuylkill and the tidal Delaware - Fish and fishlife and other vulnerable species such as mussels and migratory fish, known to live and utilize the river.

Answer:
If contamination affects certain sensitive ecological receptors, such as threatened and endangered species, it must be addressed in the cleanup. This can be accomplished through a risk assessment or remedial measures. An ecological risk assessment evaluating the ecological receptors that would be in the Schuylkill River and on site has been completed already and will be submitted through the Act 2 process upon completion of the remedial investigation phase of the project. As part of this process, chemicals at the site were evaluated in relation to the species of concern, such as the Atlantic Sturgeon and Shortnose Sturgeon. Based on this assessment, chemicals at the site were not identified as likely to impact species of concern.

Question:
Will the site-specific standard be at least as stringent as the statewide [health] standards?

Answer:
There will be a combination of statewide health and site-specific standards at this site. The lead site-specific standard calculated for the Site utilized the Adult Lead Model (ALM) and the standard PADEP default assumptions. Use of the ALM resulted in a lead site-specific standard that was higher than the statewide health standard, but nonetheless still protective of human health. As the PADEP revises its standard assumptions for lead, Evergreen will modify the lead site-specific standard accordingly. Although not proposed at this time, if site-specific standards are developed for other chemicals, the process will use site-specific conditions as inputs to the calculations, so they will be protective of the population that encounters the soils at the site. If the pathway elimination option under the Act 2 site-specific standard is used at the Site, a new standard will not be calculated, but the Cleanup Plan and Final Report will document how the entire pathway is eliminated.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
Delaware Riverkeeper Network is opposed to the site being cleaned up only to industrial use standards. This decision limits the use of the site and the cleanup required. The site is a rare opportunity for public open space and uses that are compatible with residence, mixed community use, and recreational use such as river access for paddling and water sports. The connection of people to the Schuylkill is of great value, as is demonstrated by the historically and economically important river access for rowing and boating upstream. These river friendly activities can be fostered by providing access from this property to the natural riverside on the Schuylkill and the downstream Delaware River. Most importantly,

requiring clean up to residential standards and setting cleanup standards based on human health standards and site-specific scientifically-based standards that are protective of human health and the environment will provide maximum benefit and use of the site and not condemn it to always be a source of pollution because those responsible successfully avoided the costs of cleaning up the pollution they caused.

Question:
We the environmental justice community are concerned about all of the other standards that have not been submitted yet. They were submitted with anticipated use of the site as a refinery, so are those standards going to be revised in terms of what the actual use of the property is going to be?

Question:
Will you commit to cleaning up all areas near residential off-site areas to residential health based standards? For the part of the property that will be a public park, do residential standards apply to these areas?

Answer:
Per the 2020 First Amendment to the Consent Order & Agreement dated June 26, 2020 (and the deeds transferring the parcels), PES/Hilco Redevelopment Partners is committed to continuing to use the former refinery property for non-residential use. As such, Sunoco agreed to remediate the site to non-residential use standards under Act 2, and Evergreen's future Cleanup Plans will be developed based on the non-residential use of the property.

The following questions are similar, so a combined answer is provided to address these related questions.

Question:
When will the areas be sampled that have not been sampled before because the refineries had been operating and when will that data be made public?

Question:
As the facilities are deconstructed, you will be doing the sampling that wasn't done before and that you'll be sending that data to the DEP. When you send that new data to DEP, will you make it publicly available?

Answer:
There are some areas under the old process units that weren't accessible or where it wasn't safe for us to drill or dig because of ongoing operations. Once those units have been dismantled and the areas are accessible, Evergreen will go out and do additional sampling. Evergreen has not been provided with the planned schedule of demolition of the unit areas. However, the sampling will be performed immediately upon clearing of those areas and the data will have to be submitted to the PADEP as part of the Act 2 process after sampling has been conducted.

Question:
The 2015 Human Health Risk Assessment Report [HHRA] assesses the exposure for non-residential populations. Fenceline measurements of chemicals such as benzene are above regulatory limits. What

health risk assessments have been done for nearby residential populations and are these publicly available?

Answer:
The 2015 HHRA report was completed specifically to assess lead exposure in soils to site workers. Fenceline measurements of benzene occurred as an operational task required by the EPA because it was an operating refinery at the time, and therefore, monitoring was done by PES. Evergreen is responsible for potential impacts from contamination at or below the ground surface, so that is our focus. We evaluate potential risk to off-site populations from dissolved plumes moving off-site. There was no indication from initial assessments that there is any risk to indoor/outdoor air from historic environmental data collected during the RI activities.

Question:
Evergreen should not characterize this remediation project as a voluntary cleanup.

Answer:
Act 2 is a voluntary cleanup program. Sunoco is obligated to cleanup the legacy contamination under the Act 2 cleanup program through enforceable legal agreements signed with PADEP, and Evergreen completes the cleanup on Sunoco's behalf. Therefore, Evergreen's participation is not voluntary nor does Evergreen characterize the remediation project as voluntary.

Question:

Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.

Answer:
As part of the Act 2 process, a risk assessment can be completed for a Site to develop risk based cleanup standards. The cumulative impacts from detected compounds would be included in the risk assessment activities. Evergreen cannot complete a risk assessment until the RIRs are submitted and approved, and the RIR process cannot be completed until the public comment process on the RIRs is completed.

Question:

Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on-site? What is the rationale for not sampling the others?

Answer:
The current analyte list utilized for the Act 2 program at the facility was developed after analyzing historic reports and data from previous sampling efforts, and in consideration of historic use of the site and the PADEP analyte 'short lists' for various petroleum products. Evergreen's current analyte list includes compounds indicative of the various petroleum products processed at the facility. In addition, both soil and groundwater samples from areas of the facility which historically stored and processed crude were sampled for a more comprehensive analyte list as part of the remedial investigation activities. These data have all been included in the RIRs.

Question:

Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Answer:

As presented in the RIRs, the lower aquifer (AOI 11) has been investigated during all the other AOI investigations completed since 2013, and the results were reported in the individual RIRs. The concentrations found in the deep aquifer do not indicate a potential risk to communities in New Jersey, so no cleanup is anticipated as being necessary. The projected fate and transport of contaminants in the deep aquifer will be included in the Fate and Transport RIR, which is anticipated for submittal by the end of 2021. Upon completion of the modeling, it will be confirmed whether any remedial action is necessary in the lower aquifer.

Soil

Question:
These graphics *(Evergreen note: assumption is reference to graphics from the August 27, 2020 Public Information Session relating to remediation)* all show problems relating to gasses and water…not contaminated soil. Will soil be removed and replaced with clean soil?

Answer:
The remediation systems operated at the site, historically and currently, were installed to address groundwater and/or vapors since they represented potential risk pathways, which is why they were shown during the August 27, 2020, Public Information Session. The purpose of the information session was to review historic reports, which include mostly RIRs. Remedial plans for all media, including soil, will be detailed in the future Cleanup Plan(s), as remediation options are not a topic of RIRs. While some areas of soil impact have been excavated previously, soil remediation can also include institutional and engineering controls that eliminate a risk by blocking a pathway of exposure.

Question:
Various docks have handled ships since 1866. Multiple fires have occurred on ships over the years. What is the condition of the land along the waterfront?

Answer:
The environmental impacts that have been characterized during Evergreen's Act 2 investigations along the waterfront are presented in the RIRs, specifically in AOIs 2, 3, 5, 6, 7, 8, 9 and 10.

Question:
The site contains several rail facilities (North Yard, West Yard, etc.). What are the conditions at rail terminals and along rail tracks?

Answer:
The rail facilities are located in AOIs 5 and 8. Installation of these rail facilities occurred after the property transfer to PES. Therefore, conditions near these lines resulting from their operation would not be part of Evergreen's investigations. However, the environmental conditions characterized as part of the Act 2 investigations, which included the areas below and around the current rail areas, are included in the RIRs for AOIs 5 and 8. Contaminants associated with past petroleum operations in those areas are summarized in those reports. Evergreen is unable to provide information about the operational conditions related to recent (since 2012) operations of the rails. PES would be better able to respond to those inquiries.

Question:

Lead is a heavy metal, but it will not remain stationary. Contaminated soil will be kicked up as dust by cars on the road, construction projects, and even by children at play.

Answer:

Potential dust from Site soils will be addressed through the remedies selected for the Site, which will be proposed in the Cleanup Plan. Measures to prevent dust generation during redevelopment should be included in Hilco Redevelopment Partners' site development permits.

Question:

1) We are concerned about lead in surface soil. The standard Evergreen has proposed does not address the risk.

2) Evergreen has not obtained approval from DEP for remedial investigation reports for several of the more contaminated areas of interest. Including the aquifer.

3) The work done so far does not consider the impacts of climate change, rising sea level and worsening storms. Note: for the purpose of response, this comment was split into three topics by Evergreen.

Answer:

1) The site-specific standard for lead was approved by both PADEP and EPA and utilized the updated ALM and exposure assumptions recommended by the EPA and the PADEP. As part of the remedial investigations, the lead data was compared to the Act 2 statewide health standards MSC, which is 450 ppm, based on the soil-to-groundwater pathway. This comparison is shown on the tables in the RIRs and in the August 27, 2020 presentation. The approach that was used to calculate the site-specific standard for direct contact was to use the ALM recommended by the EPA. The PADEP used the same model to develop an updated non-residential lead direct contact MSC that reflects the current state of the science for lead.

2) PADEP did not approve two of the RIRs – AOIs 4 and 9 – based on the need for additional off-site characterization, not a level of contamination over other AOIs. The characterization portion of the AOI 11 report was sufficient for approval; however, the fate and transport portion of the AOI11 report was not, which is why it was not approved. Data has been collected from the lower aquifer wells as part of the other AOI remedial investigations since 2013 and reported in the RIR submitted since 2013.

3) Characterization and delineation of contaminants of concern does not generally require consideration of climate change, sea level rise or worsening storms. Climate change will be considered in future fate and transport efforts and Cleanup Plans where that type of variable warrants consideration.

Lead – Site-Specific Standard

Question:
Why does the former refinery get special treatment compared to other non-residential sites? In terms of the lead site-specific standards in soils 0 to 2 feet

Answer:
The ability to calculate a site-specific standard (for any media) is a provision in the Act 2 regulations. It is not the only one allowed, but it is common practice and one of the three options for standards that can be applied to a site: statewide health, background, or site-specific. Other sites can also calculate a site-specific standard if they choose to do so for their Act 2 projects.

This question was also provided to PADEP, to which the following response was provided:

Pennsylvania's Land Recycling and Environmental Remediation Standards Act (Act 2 of 1995) allows the remediator to select the type of cleanup standard they wish to use for the site. One option is the site-specific standard, and risk assessments are a means available to any remediator to attain that standard. Evergreen chose to use a risk assessment to determine a site-specific standard for direct contact exposures of people with lead in surface soil (upper 2 feet). With this approach they were able to use a more current scientific methodology from U.S. EPA to calculate a risk-based value. Remediators who do not perform a site-specific analysis will generally use the published statewide health standard default cleanup values, but the site-specific standard option may be used by any remediator and it is not unique to this site.

Question:
So, you are acknowledging that the DEP is attempting to increase the non-residential surface soil lead standard to 2,500 from 1000 to accommodate the refinery site?

Answer:
The PADEP calculated a new proposed direct-contact standard based on the updated ALM and updated exposure assumptions recommended by the EPA, not to accommodate any specific site.

Question:
Why did you choose such a high site-specific standard, and do you plan to keep it that high?

Answer:
The approach used to calculate the site-specific standard for direct contact was to use the ALM, recommended by the EPA. The PADEP used the same model to develop an updated non-residential lead direct contact MSC that reflects the current state of the science for lead. If the PADEP changes its assumptions related to lead, such as permissible blood lead levels, Evergreen will update the site-specific standard accordingly.

Question:
The lead standard should be revised to be protective of public health. The standard that was approved (2240 parts per million (ppm) in surface soil) is much weaker than the default standard of 1000 ppm. The assumptions Evergreen used in calculating the standard are inaccurate and outdated.

Answer:
The site-specific standard was calculated using the updated ALM and exposure assumptions recommended by the EPA and the PADEP. The previous calculations used by the PADEP were outdated; therefore, the PADEP recently used the same updated ALM to develop an updated non-residential lead direct contact MSC that reflects the current state of the science for lead. The new calculated proposed direct contact statewide health standard for lead is in line with the site-specific standard that was calculated in 2015 for the site. If the PADEP changes its assumptions related to lead, such as permissible blood lead levels, Evergreen will update the site-specific standard accordingly.

Question:
Why isn't the site-specific standard for lead being reevaluated based on the anticipated site use (commercial warehouse)?

Answer:
The site-specific standard for lead was calculated based on non-residential (not industrial) site use, which is consistent with the planned future use. If the PADEP changes its assumptions related to lead, such as permissible blood lead levels, Evergreen will update the site-specific standard accordingly, but will continue to assume a non-residential Site use, consistent with future use.

Question:
Why is Evergreen's site-specific Lead standard (2240 ppm) so much higher than the state standard (1000 ppm)?

Answer:
The PADEP's Non-Residential MSC was derived using the Society for Environmental Geochemistry and Health (SEGH) model (Wixson, 1991). Since that time, the PADEP has endorsed the use of alternative uptake biokinetic models for the evaluation of lead toxicity including the Bower model (Bowers et al., 1994) for non-residential site uses. The EPA adapted the Bowers et al. model to develop the ALM, a widely accepted approach to risk characterization for non-residential exposure scenarios and recommended by the EPA (EPA, 2001). Evergreen used the EPA's default assumptions for assessing non-residential risks from lead exposure in the ALM model to develop the site-specific standard for lead.

Question:

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site – an important factor in determining the

site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.

Answer:
As part of the remedial investigations, Evergreen compared the lead data to the Act 2 soil-to-groundwater statewide health standard, which is 450 parts per million (ppm) and the direct contact statewide health standard, which is 1000 ppm, as well as the site-specific standard. This comparison is shown on the figures/tables in the RIRs and in the August 27, 2020 presentation. The RIRs only report the data, not remedial decisions relating to the use of lead site-specific standard. The approved site-specific standard for lead is based on updated information and models from the EPA and PADEP that reflect the current state of science for lead. If the PADEP changes its assumptions related to lead, such as permissible blood lead levels, Evergreen will update the site-specific standard accordingly.

4.0 CONCLUSIONS AND RECOMMENDATIONS

This report summarizes and responds to all of the comments received for past Act 2 reports during the public comment period. The requested 120-day comment period by the City was in reality 140 days, from August 27, 2020, to January 14, 2021. In addition, the reports re-opened for comment were posted to Evergreen's website which went live in July 2019 and this document includes responses to all questions and comments received since the initial attempted meeting in November 2019. Once the comments and responses relating to the past reports are reviewed and approved by the PADEP, Evergreen will summit the Addendum for AOI 4 RIR, the Addendum for AOI 9 RIR, and the Fate and Transport RIR. It is expected that all of these reports will be submitted in 2021. Evergreen will then be able to complete and report on future phases of the Act 2 process. Many of the questions and comments addressed in this report are applicable to and will be considered in these future phases.

Evergreen will continue to engage with the community and expects to hold quarterly Public Meetings throughout 2021, in addition to conducting other outreach activities to better communicate with the surrounding communities regarding the legacy environmental activities. Evergreen will also continue to welcome comments concerning the ongoing Act 2 activities and will provide responses on the Evergreen website, as well as during public meetings.

NOTIFICATIONS TO PUBLIC

Evergreen Resources Management
2 Righter Parkway, Suite 120
Wilmington, DE 19803

March 30, 2021

Leigh-Anne Rainford, Director
Environmental Health Services
Philadelphia Department of Public Health
321 University Avenue
Philadelphia, PA 19104

RE: Submission of Public Comment Remedial Investigation Report
Former Philadelphia Refinery
PADEP Primary Facility ID # 780190 (Site-wide)
3144 Passyunk Ave, Philadelphia, PA, Philadelphia County, PA

Dear Ms. Rainford:

This letter is to provide notice that Philadelphia Refinery Operations, a series of Evergreen Resources Group, LLC (Evergreen) is submitting a Public Comment Remedial Investigation Report (RIR) to the Department of Environmental Protection Southeast Regional Office for the former Philadelphia Refinery located at 3144 Passyunk Avenue in Philadelphia, Pennsylvania (Site). The Public Comment RIR addresses public comments that have been submitted for the Site in relation to past reports completed under Pennsylvania's Land Recycling and Environmental Remediation Standards Act, the Act of May 19, 1995, P.L. #4, No. 2 (Act 2), as well as the joint Pennsylvania Department of Environmental Protection (PADEP) and U.S. Environmental Protection Agency (EPA) One Cleanup Program. Evergreen is an affiliate of Sunoco (R&M), LLC, a former operator of the refinery, and both companies are indirect subsidiaries of Energy Transfer L.P. In November 2013, Evergreen was formed to manage Sunoco's legacy environmental cleanup at the Philadelphia Refinery.

Evergreen submitted a Notice of Intent to Remediate (NIR) to the PADEP in 2006, formally entering the Site into the Act 2 Program. At the request of the City of Philadelphia (City), Evergreen developed a Public Involvement Plan (PIP) in 2006 and updated it in 2019. The PADEP requested that Evergreen prepare the Public Comment RIR to complete the public involvement process for the Act 2 Reports that were previously submitted to the PADEP. The City requested a 120-day comment period to allow the public time to review the past reports and provide their comments. Evergreen held a virtual Public Information Session on Aug. 27, 2021 which began the comment period. Jan. 14, 2021, marked the end of the "120-day" comment period, when another virtual Public Information Session was conducted. While the purpose of the public comment period was to engage the public in reviewing previously submitted Act 2 including mostly RIRs, many comments collected to date do not relate specifically to the past reports, but rather to other topics that may be addressed in future Act 2 submittals. All comments received between November 2019 and Jan. 14, 2021, are addressed in the Public Comment RIR, regardless of topic and method of submittal (e.g. written, live during public meetings, telephone, or other methods). The comments and responses included in the text of the Public Comment RIR are also included

on Evergreen's website for the Site (https://phillyrefinerycleanup.info). An electronic copy of the Public Comment RIR will also be posted to the website and provided to two local library branches. A hard copy will be made available to you upon request. PADEP and EPA will review the report and provide comment within 90 days.

We have appreciated the opportunity to work closely with the City in the development of the Public Comment RIR as part of the implementation of our Public Involvement Plan and we look forward to continuing to collaborate with the City and the community at the former Philadelphia Refinery.

Regards,
Evergreen Resources Management Operations

Evergreen - Former Philadelphia Refinery

Pursuant to the Land Recycling and Environmental Remediation Standards Act, the act of May 19, 1995, P.L. 4, No. 1995-2., notice is hereby given that Evergreen has submitted a Public Comment Remedial Investigation Report to the Pennsylvania Department of Environmental Protection for the former Philadelphia Refinery located at 3144 Passyunk Avenue, Philadelphia, PA Philadelphia County. The Public Comment Remedial Investigation Report provides all comments received by Evergreen between November 2019 and January 2021 on previously submitted Act 2 Reports for the Site. There is no Act 2 public comment period associated with this report. However, as always, general communications can be sent to Evergreen via the website **www.phillyrefinerycleanup.info** or via email at phillyrefinerycleanup@ghd.com.

Public notice submitted via email to distribution list on 3-31-21

Public Notice – Act 2 Report Submittal
Former Philadelphia Refinery

Pursuant to the Land Recycling and Environmental Remediation Standards Act, the act of May 19, 1995, P.L. 4, No. 1995-2., notice is hereby given that Evergreen submitted a *Public Comment Remedial Investigation Report (RIR)* to the Pennsylvania Department of Environmental Protection on March 31, 2021 for the former Philadelphia Refinery located at 3144 Passyunk Avenue, Philadelphia, PA Philadelphia County. The *Public Comment RIR* provides all comments and questions received by Evergreen between November 2019 and January 2021 on previously submitted Act 2 Reports for the Site. There is no public comment period associated with the *Public Comment RIR* as it includes only comments on past Act 2 reports, no new data. However, general communications can be sent to Evergreen via the website www.phillyrefinerycleanup.info, PO Box 7275 Wilmington, Delaware, or via email at phillyrefinerycleanup@ghd.com. The report will also be posted to the aforementioned website. PADEP and EPA will provide review of the Act 2 report related comments in this document within 90 days. Many of the comments and questions included in the report will be addressed in future activities and reports.

APPENDIX B

COPIES OF INDIVIDUAL COMMENTS

Subject: Request

Hi. I am wondering if you are able to send out updates about what plans are being carried out when. For instance, if you are cleaning a particular thing, I'd like to know ahead of time when that cleaning will take place and what the risks to the surrounding environment/people are. If there are risks to people I would like to be provided with information which will allow me to identify if something in your process has gone poorly and if I need to take further precaution to keep myself and my family safe.

For example, right now there is a very strange smell outside. I am inclined to believe it may be emissions from your site. If so, what could it be?

Thank you for your time and attention.

Sincerely,
Caroline Houlihan

Subject: PES refinery

I thought the refinery was to be permanently shut down following the explosion in June of 2019? I read that Benzine levels were 30 times higher than permitted, putting them on par with levels you would see in 3rd world countries like India. Also watchdog websites went black in the weeks leading up to the explosion. There was no data available to the public in the weeks leading up to the explosion. Now I'm smelling and feeling the toxic pollution from the refinery again. Will the refinery be permanently shut down? Why was there no meeting 11/7/20. Why was Evergreen "blocked" from the meeting? Was there a meeting at all?

Subject: Clean-Up Efforts with Hilco

Hello,

My name is Gladys and I live in West philadelphia very close to Bartram Gardens. I was wondering what your plans are now that Hilco has purchased the land PES and Sunoco both left in shambles. Have you reached out to Hilco about their clean-up efforts? Will you be monitoring them for accountability over severe toxic chemical spills in the water and soil? The information on your website seems to be outdated but i recently received a letter in the mail asking us to submit comments.

I worry about our community over the river in South Philly who have dealt with countless decades of health problems due to this harmful refinery. Please keep me updated on this matter. Thank you.

Cheers,
Gladys Harlow

Subject: Philly Refinery Environmental Cleanup

Hello,

I received your mailer today and would like to be included on future communications, especially for any public meetings. Do you have any idea what is going to be done with the site, and is there any way to encourage using it as a site for renewable energy for the city?

Thank you!
Alex

Subject: Environmental concern

Hi , I currently reside in Siena Place near the borderline of the refinery . I just want to know is it safe to live there in terms of Air quality or was/is benzene a risk and in regards to the plume status affecting water or air or the properties themselves in Siena place . Recently , I have smelled Gas outside approximately on A few occasions near the end of July and don't know if that is from the refinery or cleanup process as the refinery is not currently operating . Thanks

Hi Tiffani,

Thank you for your message. At this time, the clean up circle is continuing to digest the TASC report provided by Skeo and the EPA, as well as engage with technical advisors to get a better sense for what has transpired up until now. You will most certainly hear from me as soon as it is possible for us to meet. We will also be present for your public meeting on the 27th.

Thank you,
James

Community Outreach Plan Revised (draft) - August 11 2020

Comment

Those of us who live near the refinery believe in our basic human right to have clean air, soil, and water as well as natural spaces not covered in concrete. While we are relieved that the refinery is closed, we are concerned that our needs are not being addressed by the cleanup and redevelopment process that currently exists. We demand the following:

An equal partnership with the public that is achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis.

This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced.

Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found.

The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself.

Attendee	Question	Carrie Barcomb (Unverified)	8/27/2020 23:03	Adding my support for Philly Thrive and for the people of South Philly. Specifically we demand: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis. This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced. Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found. The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself.
Attendee	Question	Carrie Barcomb (Unverified)	8/27/2020 23:03	Adding my support for Philly Thrive and for the people of South Philly. Attendee	Question	Philly Thrive (Unverified)	8/27/2020 23:03	This process needs to change to involve the public in the development of all reports, as required by Act 2 law - not just commenting after reports are produced.
Attendee	Question	Philly Thrive (Unverified)	8/27/2020 23:03	This process needs to change to involve the public in the development of all reports, as required by Act 2 law - not just commenting after reports are produced.
Attendee	Question	Tammy Murphy (Unverified)	8/27/2020 23:03	Who pays Evergreen to do this work?
Attendee	Question	Tammy Murphy (Unverified)	8/27/2020 23:03	Who pays Evergreen to do this work?

Attendee	Question	Karen M'Closkey (Unverified)	8/27/2020 23:03	This is a once in a hundred year opportunity to do right by the people who live by the site. People are eager to be involved and engaged. Will Evergreen consider a process that is less hierarchical? There are limitations due to COVID but past efforts at engagement indicate that communication is one-way rather than a dialogue. WIll you make room for smaller, topic-targeted conversation in real-time rather than this type of Q+A?
Attendee	Question	Karen M'Closkey (Unverified)	8/27/2020 23:04	This is a once in a hundred year opportunity to do right by the people who live by the site. People are eager to be involved and engaged. Will Evergreen consider a process that is less hierarchical? There are limitations due to COVID but past efforts at engagement indicate that communication is one-way rather than a dialogue. WIll you make room for smaller, topic-targeted conversation in real-time rather than this type of Q+A?
Attendee	Question	Peter Winslow (Unverified)	8/27/2020 23:05	I reiterate the demands of Philly Thrive for meaningful public involvement in all aspects of the Act 2 processes for environmental remediation of the site through a more robust PIP.
Attendee	Question	Peter Winslow (Unverified)	8/27/2020 23:05	I reiterate the demands of Philly Thrive for meaningful public involvement in all aspects of the Act 2 processes for environmental remediation of the site through a more robust PIP.
Attendee	Question	Phil Gunderson (Unverified)	8/27/2020 23:05	Why isn't the site specific standard for lead being reevaluated based on the anticipated site use (commercial warehouse)?
Attendee	Question	Kenneth Daly (Unverified)	8/27/2020 23:06	I also want to add my voice in support of the Philly Thrive demands. The people affected by what Evergreen and Hilco are doing need to be involved. Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis. This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced. Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. Attendee	Question	Ellen Neises (Unverified)	8/27/2020 23:08	We are listening to your description of Evergreen communications, but after exploring the materials at length, and attending meetings, many engaged citizens don't agree that you are offering access to synthetic materials that facilitate public conversation. Delivering 1000-page documents for comment is not democratic. Your reports can easily be designed to make key data and decisions accessible to the public. Are you willing to create living documents that update the state of knowledge about contamination, and incorporate public comment so learning is synthesized and accessible? This will make for authentic public conversation about the future of this incredibly important place in our city. The recent NYT article about PES and Philly Thrive shows that the world is watching how we do this. Evergreen can be an important leader.

Attendee	Question	Tammy Murphy (Unverified)	8/27/2020 23:09	I support the demands of Philly Thrive and all fenceline community members. Beyond presenting your goals to the community, it is the right of the community to demand and expect free, prior, and informed consent over the entire process given the health impacts of the air, water, soil, and asthetics of their community.
Attendee	Question	Tammy Murphy (Unverified)	8/27/2020 23:09	I support the demands of Philly Thrive and all fenceline community members. Beyond presenting your goals to the community, it is the right of the community to demand and expect free, prior, and informed consent over the entire process given the health impacts of the air, water, soil, and asthetics of their community.

Attendee	Question	Gabriel (Unverified)	8/27/2020 23:09	Act 2 Standard, as presented in today's presentaion, is being applied for statewide, and site specific. The presentation and presenter also reinforced the fact that the most stringent requriment must apply. If PA state's lead standard in soil is 1000 ppm, why is Evergreen proposing a site-specific standard of 2,240 ppm, which is clearly twice the quantity?
Attendee	Question	Franca Trubiano (Unverified)	8/27/2020 23:09	I also want to add my voice in support of the Philly Thrive demands. The people affected by what Evergreen and Hilco are doing need to be involved. Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis. Attendee	Question	Franca Trubiano (Unverified)	8/27/2020 23:17	It may have been more effective if this presentation was made available a week ago and we could have spent these two hours asking pertinent questions, such as: 1. what are the critical paths for considering the risks of lead and benzene to the adjacent communities; 2. how are increased climate-change risks being assessed; 3. how is ground and surface water run off being considered in the plans; 4. how is Hilco assessing the additional risks of (what looks like will be) hard scape pavement of 85-90% of the site?
Attendee	Question	Franca Trubiano (Unverified)	8/27/2020 23:18	It may have been more effective if this presentation was made available a week ago and we could have spent these two hours asking pertinent questions, such as: 1. what are the critical paths for considering the risks of lead and benzene to the adjacent communities; 2. how are increased climate-change risks being assessed; 3. how is ground and surface water run off being considered in the plans; 4. how is Hilco assessing the additional risks of (what looks like will be) hard scape pavement of 85-90% of the site?
Attendee	Question	Charles Reeves...resident action committee ll (Unverified)	8/27/2020 23:19	For years have been told what was happening only to find out it was not true we need to create an community base Advisory Board.to review everything that's going on are you willing to do that.
Attendee	Question	Charles Reeves...resident action committee ll (Unverified)	8/27/2020 23:19	For years have been told what was happening only to find out it was not true we need to create an community base Advisory Board.to review everything that's going on are you willing to do that.
Attendee	Question	Mike (Unverified)	8/27/2020 23:20	What are some of the possible risk pathways that you've encountered at the refinery? How are you dealing with them?

Attendee	Question	Alexa Ross (Unverified)	8/27/2020 23:20	Thank you for doing your best to use plain language and take the measures you have to try to include the public, as is required by Act 2. Will you hold more regular small group sessions, as a necessary precursor to the public being able to submit educated comments? Information only presented in a one-way format does not enable true public engagement. Please support Philly Thrive's demands: Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis. This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced. Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found.
Attendee	Question	Elisa McCool (Unverified)	8/27/2020 23:20	The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself.

If not, why not?
Attendee	Question	Alexa Ross (Unverified)	8/27/2020 23:28	What would lead you to not agree to Philly Thrive's request for creation of a community advisory board to be in ongoing consultation with you, given you don't know the surrounding neighborhoods?
Attendee	Question	Alexa Ross (Unverified)	8/27/2020 23:28	What would lead you to not agree to Philly Thrive's request for creation of a community advisory board to be in ongoing consultation with you, given you don't know the surrounding neighborhoods?
Attendee	Question	Pouné Saberi (Unverified)	8/27/2020 23:28	Is the water table or the lower aquifer the source of drinking water for anyone?
Attendee	Question	Pouné Saberi (Unverified)	8/27/2020 23:28	Is the water table or the lower aquifer the source of drinking water for anyone?
Attendee	Question	Phil Gunderson (Unverified)	8/27/2020 23:29	When will Evergreen conduct the fate and transport analysis for the lower aquifer? There is no aquitard between upper and lower aquifer across most of the site. Won't the heavily contaminated shallow aquifer gradually leach contaminants into the lower aquifer? (a critical drinking water source for New Jersey)
Attendee	Question	Phil Gunderson (Unverified)	8/27/2020 23:30	When will Evergreen conduct the fate and transport analysis for the lower aquifer? There is no aquitard between upper and lower aquifer across most of the site. Won't the heavily contaminated shallow aquifer gradually leach contaminants into the lower aquifer? (a critical drinking water source for New Jersey)
Attendee	Question	Carrie Barcomb (Unverified)	8/27/2020 23:30	Philly Inquirer (8/3/2020) says Hilco is calling for an "exposure barrier," instead of removal. How extensive is contamination beyond the site. Concerned this does not address the health and environmental rights of the local community, nor account for sea-level rise and climate change flooding.
Attendee	Question	Carrie Barcomb (Unverified)	8/27/2020 23:30	Philly Inquirer (8/3/2020) says Hilco is calling for an "exposure barrier," instead of removal. How extensive is contamination beyond the site. Concerned this does not address the health and environmental rights of the local community, nor account for sea-level rise and climate change flooding.
Attendee	Question	Phil Gunderson (Unverified)	8/27/2020 23:31	Why is there no mention of climate change in discussion of the Water-table aquifer? These levels could change by multiple feet in the next few decades?
Attendee	Question	Phil Gunderson (Unverified)	8/27/2020 23:31	Why is there no mention of climate change in discussion of the Water-table aquifer? These levels could change by multiple feet in the next few decades?
Attendee	Question	Mick (Unverified)	8/27/2020 23:32	Could you talk more about the topmost 'fill' layer in the Environmental Setting slides ... how deep is this fill, what is it composed of? When was it added there? Thank you!
Attendee	Question	Mike (Unverified)	8/27/2020 23:32	Are the aquifers used as a drinking water source for the city?
Attendee	Question	Mick (Unverified)	8/27/2020 23:32	Could you talk more about the topmost 'fill' layer in the Environmental Setting slides ... how deep is this fill, what is it composed of? When was it added there? Thank you!
Attendee	Question	Mike (Unverified)	8/27/2020 23:32	Are the aquifers used as a drinking water source for the city?
Attendee	Question	Matt Walker (Clean Air Council) (Unverified)	8/27/2020 23:35	When will Evergreen submit its revised remedial investigation reports for Areas of Interest 4, 9 and 11?
Attendee	Question	Matt Walker (Clean Air Council) (Unverified)	8/27/2020 23:35	When will Evergreen submit its revised remedial investigation reports for Areas of Interest 4, 9 and 11?
Attendee	Question	Anonymous (Unverified)	8/27/2020 23:36	Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis.
Attendee	Question	Meredith (Unverified)	8/27/2020 23:36	Are your LNAPL bodies in Slide 32 a result of shallow, deep or both wells being gauged?
Attendee	Question	Anonymous (Unverified)	8/27/2020 23:36	Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis.

Attendee	Question	Jocelyn (Unverified)	8/27/2020 23:40	As a Grays Ferry resident, I'm very concerned about the clean up and the lack of community involvement in the process as well as minimal communication with the community as to the health hazards and potential risks. There needs to be meaningful inclusion of community members throughout the Act 2 process, which means open access to information, feedback, and frequent consultation. This can be accomplished by creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis. None of the work that's been done so far has involved active outreach to ALL community members.
Attendee	Question	Jocelyn (Unverified)	8/27/2020 23:40	As a Grays Ferry resident, I'm very concerned about the clean up and the lack of community involvement in the process as well as minimal communication with the community as to the health hazards and potential risks. Attendee	Question	Matt Walker (Clean Air Council) (Unverified)	8/27/2020 23:50	The lead standard should be revised to be protective of public health. The standard that was approved (2240 parts per million (ppm) in surface soil) is much weaker than the default standard of 1000 ppm. The assumptions Evergreen used in calculating the standard are inaccurate and outdated.
Attendee	Question	Matt Walker (Clean Air Council) (Unverified)	8/27/2020 23:51	The lead standard should be revised to be protective of public health. The standard that was approved (2240 parts per million (ppm) in surface soil) is much weaker than the default standard of 1000 ppm. The assumptions Evergreen used in calculating the standard are inaccurate and outdated.
Attendee	Question	Matt Walker (Clean Air Council) (Unverified)	8/27/2020 23:52	Since Evergreen used an inappropriate standard as a basis for its remedial investigation reports, how does it justify that it has correctly defined the extent of lead contamination?
Attendee	Question	Matt Walker (Clean Air Council) (Unverified)	8/27/2020 23:52	Since Evergreen used an inappropriate standard as a basis for its remedial investigation reports, how does it justify that it has correctly defined the extent of lead contamination?
Attendee	Question	Gabriel (Unverified)	8/27/2020 23:53	In today's presentation, related to lead, the presenter described that 'it is a complex process' for 'choosing the standard' associated with lead contamination levels and its subsequent categorization. Why does the entity responsible for contamination clean-up (and their supporting team) have the option to choose their standard for clean-up? Who is the authority having jurisdiction who reviews the selected standard? Are other standards more stringent? If so, why were those standards not used for these contaminants in this case?

Attendee	Question	Gabriel (Unverified)	8/28/2020 0:05	In today
Attendee	Question	Philly Thrive (Unverified)	8/28/2020 0:06	A presentation where more than 3/4 of the time is spent in a one-way flow of information and where residents' concerns are relegated to a still-diminishing-and-to-be-seen Q & A period at the end of the meeting does not bode well for a process that is inclusive of the public, as the City has requested and as the law requires.
Attendee	Question	Philly Thrive (Unverified)	8/28/2020 0:06	A presentation where more than 3/4 of the time is spent in a one-way flow of information and where residents' concerns are relegated to a still-diminishing-and-to-be-seen Q & A period at the end of the meeting does not bode well for a process that is inclusive of the public, as the City has requested and as the law requires.
Attendee	Question	Phil Gunderson (Unverified)	8/28/2020 0:07	These are very informative graphics. What about removal of contaminants that are in the soil? Lead cannot be pumped out. All of the soil must be removed.

Attendee	Question	Phil Gunderson (Unverified)	8/28/2020 0:07	These are very informative graphics. What about removal of contaminants that are in the soil? Lead cannot be pumped out. All of the soil must be removed.
Attendee	Question	Debbie Robinson (Unverified)	8/28/2020 0:09	Can we get some documentation saying that your company has started cleaning any part of this site
Attendee	Question	Debbie Robinson (Unverified)	8/28/2020 0:09	Can we get some documentation saying that your company has started cleaning any part of this site
Attendee	Question	Mike Ewall (Energy Justice Network) (Unverified)	8/28/2020 0:10	When will we get information comparing ALL of the available remediation methods in terms of cost, effectiveness, and community impacts (such as air emissions from the remediation process itself)?
Attendee	Question	Mike Ewall (Energy Justice Network) (Unverified)	8/28/2020 0:10	When will we get information comparing ALL of the available remediation methods in terms of cost, effectiveness, and community impacts (such as air emissions from the remediation process itself)?
Attendee	Question	Peter Handler (Unverified)	8/28/2020 0:10	These graphics all show problems relating to gasses and water...not contaminated soil. Followu to Phil Gunderson....will soil be removed and replaced with clean soil?
Attendee	Question	Ellen Neises (Unverified)	8/28/2020 0:10	Tonight's Information Session offers a strong basic primer on geology, groundwater and characterization of the contamination readings, and the presenters are very good at explaining things. Many engaged community members have already studied this material together, and with a variety of other subject matter experts, and are ready to move on to learning more about the key decisions being made now (or soon) about contamination management and clean up. Similarly, at the recent meeting held by SKEO and EPA, representatives were resistant to answering public questions beyond the scope of the TASC report. Limiting what information will be given to the public to arbitrarily defined packages does not support “meaningful engagement” or transparency as defined by the law. I agree with other suggestions that Evergreen and others focus future discussion on critical paths for decisionmaking about management of risks to adjacent communities and the ecological future of the site. As this meeting approaches its end, will you commit to a part 2 of this meeting, in the near future, to discuss decisionmaking?
Attendee	Question	Peter Handler (Unverified)	8/28/2020 0:10	These graphics all show problems relating to gasses and water...not contaminated soil. Followu to Phil Gunderson....will soil be removed and replaced with clean soil?
Attendee	Question	Ellen Neises (Unverified)	8/28/2020 0:11	Tonight's Information Session offers a strong basic primer on geology, groundwater and characterization of the contamination readings, and the presenters are very good at explaining things. Attendee	Question	Jisoo Kim (Unverified)	8/28/2020 0:23	1. Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis. 2. This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced. 3. Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found. 4. The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself.

Attendee	Question	Jon R (Unverified)	8/28/2020 0:34	It seems like many of the RIRs are still pending despite Hilco's plans to start construction in 2021. 1) What AOIs are planned to be clear to build in 2021 and 2) what are the states of their RIR and Remedial Action Reports such that building can occur so soon. 3)If they are starting in the North, AOI 8 has an identified benzene plume that exceeds the site boundary to the north. There is a sample point in the lower aquifer on the boundary that is outside of the active and inactive remediation boundaries. What are the remediation activities that need to be done prior to construction to adress these needs?

This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced. Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found.

Comment

We need a complete cleanup of the Philly Refinery Site that protects the health of the surrounding community using the strictest possible standards, includes broad community input, and holds Sunoco accountable for the devastation they've caused.

In this process, special consideration must be paid to cleaning up lead and other toxic contaminants, using the most rigorous health-based standards available. Evergreen must also provide a sufficient analysis of and a plan for effectively and safely cleaning up contaminants in the deep aquifer.

Sunoco should also be held responsible for the decades of destructive pollution they caused. This pollution has had direct, horrible impacts on community health in the surrounding neighborhood and has fueled the devastating climate crisis.

Finally, we need community involvement and input at every step of the cleanup and remediation process. This has been sorely lacking thus far, so I want to echo and express my support for the demands of Philly Thrive outlined below:

-Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis.

-This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced.

-Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found.

-The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself.

Thank you.

Hello,

I would like to voice my support of immense public involvement in the process of determining what is best for the environmental safety and security of Philadelphia's most vulnerable citizens. My demands are as follows:

1. Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis.

2. This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced.

3. Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found.

4. The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself.

Thank you for your time.

-This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced.

-Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found.

-The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself.

Thank you.

Community Outreach Plan Revised (draft) - August 11 2020

Comment

1. Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis.

2. This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced.

3. Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found.

4. The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself.

Subject: comments for the refinery cleanup

1. Its been over a century of contamination and the #1 source (by far) of the worst air pollution in Philadelphia. We are not going to let that ever happen again.
2. Our neighborhood has suffered enough. Do the right thing and LISTEN to the issues so you can rebuild a profitable high profile site.

We're asking for:

1.
2. Equal partnership with the public by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis.

Hello,

I would like to voice my support of immense public involvement in the process of determining what is best for the environmental safety and security of Philadelphia's most vulnerable citizens. My demands are as follows:

1. Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis.

2. This process needs to change to involve the public in the development of all reports, as required by Act 2 law- not just commenting after reports are produced.

3. Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found.

4. The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself.

Thank you for your time.

Hi , I live in Siena place . I noticed that Benzene concentration is a light green and close to the dark green shaded areas in the same spot as my current house (very close to pha housing and refinery) . I think it was in the lower aquifer and water table aquifer. Because it is right below my house it seems from the map, can this present a danger to me or the house ? Like can my water and be affected ? And gas vapors be present ? Or is it totally safe to live in this area even though it is below ground ? Thanks

Comment

I am a resident of Philadelphia and a proud supporter of Philly Thrive. I attended last fall's "community meeting" and can see that the process as it stands does not allow for residents of neighborhoods near the former refinery site to meaningfully take part in deciding the future of the land, including site clean-up to the standard that many neighbors want.

Equal partnership with the public needs to be achieved by: (1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process and (2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis. This process needs to change to involve the public in the ***development*** of all reports, as required by Act 2 law- not just commenting after reports are produced.

Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found. The Public Involvement Program should allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself. It must not remain sporadic, opaque, overly technical, and perfunctory (i.e. decisions are made ahead of time and little to nothing changes when neighbors "give input").

Community Outreach Plan Revised (draft) - August 11 2020

Comment

Equal partnership with the public is needed to ensure that the refinery clean up does not continue to poison residents who have been poisoned for generations--and what kind of new life is possible for the land.

This can only be effectively achieved by:

(1) creating a series of public meetings in a small-group format to allow for meaningful public engagement throughout the Act 2 process, and

(2) creating a community-based advisory group to solicit questions and comments, and evaluate the effectiveness of the PIP on an ongoing basis.

This process needs to involve the public in the **development of all reports**, as required by Act 2 law- not just commenting after reports are produced.

Reports completed since 2006 with virtually no public involvement should be reopened and revised based on public comments that find any inadequacies in the reports. We should be able to call for revision of previously approved reports if new information is found.

A sincere and effective Public Involvement Program must allow for proactive, two-way consultation between Evergreen and the community about the clean up, throughout the development of the reports and the clean up itself.

Thank you.

To: Philly Refinery Cleanup
Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water

table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

I am disgusted and appalled. Why is no one here from the city/ city council? We went to the polls yesterday and stood up for you! This whole process stinks. Top priorities are: starting the cleanup of this filthy site before it does more harm to the air + the water table. This is an emergency! Not a time for stalling! Other top priority is caring for your sacked employees — training them for new, GREEN careers! Get with the future!

The people are demanding a statement saying the refinery will remain shut forever — and that the land + property will be remediated to an extent which is appropriate for human life — well beyond that of continued refining. The seas are rising and 7 needs to be clear.

Subject: Thursday's hoped-for meeting

Wanted to apologize for the HUGE protest at your proposed meeting last night - I did not participate in the protest and DID want to hear what you-all were coming to say - even was not allowed inside the school when I arrived 2 hrs. early, so had to wait out in the cold til doors finally partially opened and someone gave me a chair inside for last few minutes til doors fully opened. Will try to access your website to read what you were going to say. Did tell a couple people in the protest that a lawyer IS the best way to get their feelings known, but they just kept saying they could not afford. - DO NOT feel this kind of protest does ANY good for them!!!!

Subject: Qs to answer RE: PES, Sunoco & Act 2

Please submit these questions in lieu of the public meeting on 11/7, with answers to be published as soon as possible.

1. When will the revised RIRs for AOIs 4, 9 and 11 be submitted?
2. Have you submitted draft cleanup plans to DEP?
3. What is the status of your groundwater and aquifer modeling for all pollutants?
4. What investigation has been done to identify contamination to soil or groundwater beyond the property boundary (offsite)?
5. What is being done to prevent contaminated groundwater from entering the Pollock and 26th St Sewers?
6. What is the quality of the water discharged from the Pollock St well system into the Schuylkill?
7. Is there a permit for the discharge of water from the wastewater treatment system to the PWD? Who is the permittee? Have the permit requirements been met?
8. What sea level rise, if any, was the tide gate built to accommodate?
9. Will Evergreen be incorporating climate resilience into its groundwater modeling? 10. Should the groundwater remediation systems that were discontinued be restarted? If not, why not? If so, when will that happen?
11. Why is Evergreen's site-specific Lead standard (2240 ppm) so much higher than the state standard (1000 ppm)?
12. Why did it take 10+ years, and an almost-catastrophic explosion, for Evergreen to come back and engage the public?
13. Please explain the formal, legal, and/or organization ties that Evergreen has to Sunoco and/or Energy Transfer.
14. Does Evergreen consider the 11/7 "event" a formal meeting, and if so, does this start the timeline for them? If it does not, when will the next meeting be held?

Subject: Request for Refinery Cleanup Info - Drexel Student Project

Hello,

My name is Harvin Bhandal and I am a senior at Drexel University. I am apart of a senior design project group tasked with developing a remediation strategy for the PES site refinery. Our area of focus is AOI-8.

I attended the public meeting on November 7th and was also disappointed that it ended up being cancelled due to protesters.

I was wondering if we could receive a copy of the clean up plan, and if you have any updated information about the contaminant levels/subsurface conditions (including boring logs, soil bearing capacity recommendations, etc). We are currently using the AOI-8 RIR Report from 2017 to conduct our analysis.

We look forward to hearing back from you!

Thanks,

Harvin

Subject: remediation questions

Please keep me on your mailing list, and submit these questions in lieu of the public meeting on 11/7, with answers to be published as soon as possible.

1. When will the revised RIRs for AOIs 4, 9 and 11 be submitted?
2. Have you submitted draft cleanup plans to DEP?
3. What is the status of your groundwater and aquifer modeling for all pollutants?
4. What investigation has been done to identify contamination to soil or groundwater beyond the property boundary (offsite)?
5. What is being done to prevent contaminated groundwater from entering the Pollock and 26th St Sewers?
6. What is the quality of the water discharged from the Pollock St well system into the Schuylkill?
7. Is there a permit for the discharge of water from the wastewater treatment system to the Phila Water Dept? Who is the permittee? Have the permit requirements been met?
8. What sea level rise, if any, was the tide gate built to accommodate?
9. Will Evergreen be incorporating climate resilience into its groundwater modeling?
10. Should the groundwater remediation systems that were discontinued be restarted? If not, why not? If so, when will that happen?
11. Why is Evergreen's site-specific Lead standard (2240 ppm) so much higher than the state standard (1000 ppm)?
12. Why did it take 10+ years, and an almost-catastrophic explosion, for Evergreen to come back and engage the public?
13. Please explain the formal, legal, and/or organization ties that Evergreen has to Sunoco and/or Energy Transfer.
14. Does Evergreen consider the 11/7 "event" a formal meeting, and if so, does this start the timeline for them? If it does not, when will the next meeting be held?
15. Who is GHD? And what is their relationship to Evergreen and Sunoco and ET?
16. Have you considered remediating with bacteria? Or mycelium? WE understand they're both more affordable options.

Regards,
Meenal Raval

Subject: PES refinery inquiry

Hi Ms. Doerr,

My name is Georgia Ray and I'm a junior at the University of Pennsylvania. I'm currently taking a community-based environmental health course and I was given your name by Kevin Bilash who came to speak to our class on issues regarding the PES refinery.

My particular project has to do with the environmental effects of the refinery on water and after speaking to Kevin, I was particularly interested in gathering more information on what the cleanup project was going to look like. Obviously, as a part of Evergreen, I thought that you would be a very useful person to speak to.

I am free all day tomorrow after 10am EST and Monday after noon EST. If you have any availability for a phone call during those times, that would be very helpful. If you aren't free at either of those two times, we can also discuss availability later next week. Additionally, feel free to let me know if you have any questions or would like any more information about the project!

I'm looking forward to hearing from you!

Best,

Georgia

Subject: Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Alex Bomstein

Subject: Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Max Temnogorod

Subject: Please read: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Friday, December 4, 2020 7:26:28 PM

Evergreen Resources,

Hi! Please read with compassion.

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop

Philadelphia, PA 19119

appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Jill Turco

From: Debbie Robinson
To: Philly Refinery Cleanup
Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Thursday, December 10, 2020 2:42:35 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

To: Philly Refinery Cleanup
Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Thursday, December 10, 2020 6:09:14 AM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Evergreen Resources,

I appreciate the work and research Philly Thrive has put into coming up with the following recommendations and sign off on each one of them! The clean up at the refinery site must be thorough and complete, and take into consideration the health and well-being of the humans who live in its shadow - not just arbitrary standards! It's especially disturbing to see learn about the "site-specific" standards for things like lead. I understand that the site is very contaminated and that remediation processes aren't simple or cheap. However, the extra costs should not be paid by our health!! The resources to do this remediation right exist, they just need to be put in the correct places. Build health for the community instead of wealth for yourselves.

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Thursday, December 10, 2020 1:56:51 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Jessica Bellwoar

Evergreen Resources,

Please listen to the people who have no interests other than the health of their loved ones. Please understand that people are not exaggerating that generations have been suffering from the toxicity of the previous oil refinery's existence, and do not belittle their concerns. Everything is fixable, the question is who will you choose to represent, the people and their health or corporate levers of power? I hope it's not the latter. Clean this area up THOROUGHLY.

- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Friday, December 11, 2020 12:18:38 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Subject: Re: Philly Refinery -Virtual Public Information Session
Date: Friday, December 11, 2020 2:52:43 PM

will a Zoom link be sent?

On 12/11/2020 1:05 PM Evergreen <phillyrefinerycleanup@ghd.com> wrote:

Virtual Public Information Session
Former Philadelphia Refinery

Evergreen to hold a virtual Public Information Session to discuss the Legacy Environmental Cleanup of the former Philadelphia Refinery

The purpose of this session is to provide a live question and answer period regarding the Act 2 remediation program at the facility. This meeting will mark the end of a 120-day review period during which previously submitted reports to the PADEP were reopened for an additional public comment period. There will be future meetings and opportunities for public involvement subsequent to this event.

Many of the questions and comments submitted to date have already been uploaded to Evergreen's website. Additional comments/questions and responses are being uploaded periodically. All Q&A received through the January information session will be uploaded to the site and also provided to PADEP in a Public Comment Remedial Investigation Report.

What: Virtual Public Information Session
When: 6:30 to 8:00 p.m., Jan. 14, 2021
Where: Zoom Webinar

The event link will be posted to www.phillyrefinerycleanup.info at least 24 hours prior to the event time under the Public Involvement tab and will be sent via email to those on the email distribution list.

If you do not have access to the internet or a computer/mobile phone, a phone number will also be provided prior to the event for dial-in participation. Those calling in will also be able to ask live questions.

If this will be your first time attending a **Zoom Webinar Event** , please try the link at least 24-hours in advance to ensure there are no technical problems. You do not need the Zoom app to participate – simply click on the link; however, to watch from a mobile device, you may need to download the Zoom app.

There will be no presentation during the planned session in order to allow the entire session to be devoted to a live Q&A session. The public is encouraged to review the website Q&A for information prior to the session.

The public is encouraged to provide input before or during the Public Information Session through any of the methods listed below:

- **Website at www.phillyrefinerycleanup.info**
- **Email Evergreen at phillyrefinerycleanup@ghd.com**
- **U.S. mail at (P.O. Box 7275, Wilmington, DE 19803)**

All input is valued equally, regardless of the method of input.

For information about environmental cleanup at the former Philadelphia Refinery, please visit www.phillyrefinerycleanup.info. To be added to future email distribution of public notices, you may do so on the Public Involvement tab of the website.

Date:	Friday, December 11, 2020 3:26:33 PM

Dear Evergreen,

1. Is there any involvement of Hilco, the new owner?

Thanks for putting the relevant documents online with the Library!

2. Are you aware which Philadelphia City officials are charged with reviewing the documents?

3, Many of the finalized online reports reflect reviews done between 2011 to 2016 with no updates. How can I learn what happened next. Is there a person to contact with specific, referenced questions, which would be onerous for a Zoom conference.

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Community Outreach Plan Revised (draft) - August 11 2020

Comment

On page 8 of the TASC report, “Remedial Investigation Reports Review, June 2020,” there is a figure “Hydrogeologic layers at the Site (Source: Evergreen).”

1. What is the composition of the layer labeled ‘Fill’?
2. Does Evergreen know from where the fill was obtained? Is river dredging/channel widening one possible source for this fill?
3. Is it possible to get a high resolution file of this figure? It’s very hard to read in the report. Thank you.

Community Outreach Plan Revised (draft) - August 11 2020

Comment

A) On the Q+A page, responding to the question “The hydrological situation is changing …” Evergreen’s response includes the words "climate changes predicted to occur within the anticipated timeframe to completion will be considered.”

B) On the Q+A page, responding to the question “Climate change-generated sea-level rise (Schuylkill, Delaware) is a given” Evergreen’s response includes the words "… i.e., how many years are predicted for Evergreen to meet Cleanup goals under Act 2 compared to the magnitude of climate change predictions within that general time period.”

Both of these responses imply that only the amount of sea-level rise that occurs during the clean-up operation will be considered. However, sea level rise will continue to affect the site for decades, or perhaps centuries.

1. Can Evergreen confirm (in plain English) that it is only considering sea-level rise for the duration of the remediation project?
2. If so, why is Evergreen not considering long-term sea level rise and its impact on aquifers into account, when considering the remediation plans for the site?

Thank you.

Comment

On the Q+A page, responding to the question “Evergreen’s answer on the website to the question of whether climate change will be incorporated in the groundwater modeling ...”, Evergreen’s response includes the sentence "Evergreen plans to evaluate climate change data … will include a review of available literature on climate change predictions for the Philadelphia region.”

1. It would be useful to see which sources Evergreen is consulting. Will Evergreen share a bibliography of the sources that you have consulted with the public?

(For what it’s worth I’d be happy to share sources with you, maybe in another comment so it is part of the public record.)

Report

Community Outreach Plan Revised (draft) - August 11 2020

Comment

On the Q+A page, responding to the question "Why is there no mention of climate change in discussion of the Water-table aquifer? ...", the response includes the sentence "Evergreen recognizes that climate changes are predicted that could alter local hydrologic conditions near the facility, such as higher water levels in the water-table aquifer or higher tides in the Schuylkill River."

This misrepresents the nature of climate change and sea level rise. It's not a question of higher tides. Everything will be higher - low tides, mean water levels, and high tides. Everything is going to go up. This will affect both the Schuykill (as far as it is tidal, to the art museum), and the Delaware.

1. What sources and estimates for climate change and sea level rise is Evergreen working with?
2. What is the maximum value for sea level rise that Evergreen is considering?
3. Sea-levels will continue to rise at least into the next century. What time-scale, in terms of years from now, does Evergreen consider adequate to ‘future proof’ the site from rising sea levels?

Thank you.

B) On the Q+A page, responding to the question “Climate change-generated sea-level rise (Schuylkill, Delaware) is a given” Evergreen’s response includes the words "… i.e., how many years are predicted for Evergreen to meet Cleanup goals under Act 2 compared to the magnitude of climate change predictions within that general time period.”

Both of these responses imply that only the amount of sea-level rise that occurs during the clean-up operation will be considered. However, sea level rise will continue to affect the site for decades, or perhaps centuries.

1. Can Evergreen confirm (in plain English) that it is only considering sea-level rise for the duration of the remediation project?
2. If so, why is Evergreen not considering long-term sea level rise and its impact on aquifers into account, when considering the remediation plans for the site?

Thank you.

Report

Community Outreach Plan Revised (draft) - August 11 2020

Comment

On the Q+A page, responding to the question "Why is there no mention of climate change in discussion of the Water-table aquifer? ...", the response includes the sentence "Evergreen recognizes that climate changes are predicted that could alter local hydrologic conditions near the facility, such as higher water levels in the water-table aquifer or higher tides in the Schuylkill River."

This misrepresents the nature of climate change and sea level rise. It's not a question of higher tides. Everything will be higher - low tides, mean water levels, and high tides. Everything is going to go up. This will affect both the Schuykill (as far as it is tidal, to the art museum), and the Delaware.

1. What sources and estimates for climate change and sea level rise is Evergreen working with?
2. What is the maximum value for sea level rise that Evergreen is considering?
3. Sea-levels will continue to rise at least into the next century. What time-scale, in terms of years from now, does Evergreen consider adequate to ‘future proof’ the site from rising sea levels?

Thank you.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Monday, December 14, 2020 2:45:14 AM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: RE: public comments, Philadelphia Refinery
Date: Monday, December 14, 2020 5:46:05 PM

Hi Dave,

Thanks for passing those along. We'll keep the document for record and update it as received from you. Those are the same messages that we've also received from Clean Air Council. We've also logged each one for the record. We see three comments that require response in their emails:

1. Reduction of the lead standard
2. Revising RIRs to include climate change
3. Validity of data in the reports based on age

The first two have already been asked and answered in various forms on the website, but we plan to upload CAC's exact comments to the Q&A page and Public Comment RIR so that it's clear that we're responding to their concerns directly. The third question is not one we've received previously but will also provide a response. Does DEP plan to provide response to these comments since they were sent to DEP directly? I know you've also provided response to the lead comment in general, but not the other two and I think they would benefit from DEP response.

Please let me know how you plan to proceed and if you want to discuss. I did want to ask how you envision Evergreen incorporating the answers that you provided previously to comments that I had forwarded. I was thinking that we'd post the question/comment like we have all of the others and add a note to the response like "Note: DEP provided the following response to the comment above." Let me know if that makes sense and if you want it to be validated further with reference to an email date or your name, etc.

Thanks,

Tiffani,

Last week we received 81 public comments on the Act 2 reports, attached. These are based on a Clean Air Council form letter and focus on the lead standard and climate change. They may have also sent the comments to Evergreen, but in case some didn't I'm providing them to you. If we receive more I'll append them to this document and get you an update.

Date: Thursday, December 17, 2020 11:34:52 PM

Evergreen Resources,

Please, right the wrongs of the past by doing a proper job of cleaning up the PES Refinery; do NOT do the bare minimum because, while this makes things easier on your end, the Philadelphia community has already suffered far too much to have you perform a slap-dash job as currently planned.

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.

- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Thursday, December 17, 2020 7:04:43 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

To:	Philly Refinery Cleanup
Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Tuesday, December 29, 2020 7:10:58 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Darryl Roberts

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. Furthermore, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Harley Frances

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Thursday, December 31, 2020 2:47:27 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Evergreen Resources,

Do it right the first time! There's an opportunity to set an example here, and redevelop this area in a way that the surrounding community can be excited about! Take the time, spend the money, clean it up properly the first time. Think long term about this land!

Dear phillyrefinerycleanup.info,

Any remediation plan should include the planting of trees and installation of robust riparian buffer zones (100' or greater), cleared of invasive plants and with an eye towards native species (selected with the goal of maximizing phytoremediation, air purification and riparian habitat restoration) should be included as part of the solution.

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. From: Rylie Parton
To: Philly Refinery Cleanup
Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Monday, January 4, 2021 1:06:05 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Monday, January 4, 2021 7:39:43 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Monday, January 4, 2021 12:22:38 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Vivian Murray

Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Jack Byerly

From: Terri Soifer
To: Philly Refinery Cleanup
Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Monday, January 4, 2021 10:03:06 AM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

From:	Charles Homler
To:	Philly Refinery Cleanup
Subject:	Parcel AOI-10 - West Yard
Date:	Tuesday, January 5, 2021 5:09:51 PM
Attachments:	bartrams list.csv FDR Park.csv

To Whom It May Concern,

My name is Chuck Homler and I am a local wildlife photographer. Every spring I head to Bartram's Gardens for birdwatching and photography. I also visit a number of other locations in the area, some that are also on the banks of the Schuylkill River. The Schuylkill, being tidally influenced from where the Fairmount Waterworks to the Delaware River, is much cleaner above the falls. Oil slicks are visible along the banks of Bartram's Garden and even from the Schuylkill Banks trails installed between South Street and the Art Museum.

In the water, asides from waterfowl and gulls, I've seen muskrats and a beaver was spotted there a few times last year, close to 676.

With the closing of PES an opportunity to restore wetland habitat to the river shouldn't be overlooked. Wetlands purify water and remove contaminants. They also provide habitat for wildlife. And wildlife habitat with accessibility attracts people and helps expose kids to ecology.

https://sciencing.com/do-wetlands-purify-water-7585568.html
https://www.nps.gov/keaq/learn/education/water-filtering-of-wetlands.htm
https://pubmed.ncbi.nlm.nih.gov/19589001/

With that being said - Parcel AOI-10, the West Yard, is just downstream from Bartram's Gardens and is cutoff from the PES facilities on the eastern banks of the river. While river access for barges or boats may be attractive for the future development, creating habitat along the banks of the river, will not only clean and beautify the area, but could also protect the redevelopment from flooding or water damage.

Attached are two lists of birds that I have observed at Bartram's Gardens and nearby in FDR Park.

If it would help, I can also share images and experiences with the wildlife on the Schuylkill.

My Best,
Chuck Homler

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Tuesday, January 5, 2021 8:54:08 AM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Kevin Foskett

Subject: My comments on the Public Involvement Process, Outreach Plan, and Lead Report
Date: Wednesday, January 6, 2021 12:18:42 AM

Evergreen Resources,

Hello and happy new year. I'm writing as a concerned citizen and community member, to register my grievances in regards to the cleanup of the former PES Refinery site in South Philadelphia and the public outreach plan that accompanies this cleanup.

I have taken the time to write to you today because I have friends who have grown up and lived near this contaminated site, and I have seen their health suffer as a direct result. I would not wish for any person to suffer the same experiences that my friends have gone through due to their exposure to the contaminants at the PES site. They have had family die far too young, after painful battles with cancer, asthma, and eye problems. I urge you to remember that this cleanup will have powerful reverberations in the lives of real people-- and I hope you can find enough empathy within yourself and your organization to conduct the cleanup as if it were your own loved ones living near this site.

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues. Thank you for taking the time to read these comments and address them fully.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative

significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Rob Hewitt

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Carl Gershenson

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Friday, January 8, 2021 8:11:29 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Friday, January 8, 2021 6:00:57 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Sunday, January 10, 2021 5:10:20 AM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Date: Monday, January 11, 2021 11:18:27 AM

Evergreen Resources,

As a former long term resident of Philadelphia, where I also studied environmental studies and became intimately familiar with the environmental injustices committed in the city, this issue is of great value to me and I hope to you as well. There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a

decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Monday, January 11, 2021 11:28:42 AM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Thank you for your time.

RE: Please strengthen cleanup plan for PES refinery

Dear ,

Dear Evergreen Resources,

I'm writing to call on you to strengthen the proposed cleanup and remediation plan for the South Philadelphia PES refinery site.

Specifically, I call on you to:
- Strengthen remediation standards for lead to mirror Pennsylvania's statewide standards for cleanup;
- Set standards for PFAS contaminants that may be found at the site;
- Address PA-DEP's concerns about migration of contaminants that could pollute drinking water sources for New Jersey residents;
- Include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Thank you in advance for including these criteria, and I look forward to hearing your response.

Sincerely,
Ms. Macklyn Hutchison

From: Maura Stephens
To: Philly Refinery Cleanup
Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Monday, January 11, 2021 11:51:52 PM

Evergreen Resources,

My family has experienced the pain and suffering of environmentally caused illnesses. We have felt the helplessness and fury at the lack of regulatory oversight and enforcement of laws that were intended to protect people and our environment from the health harms perpetrated by polluting corporations. And we have felt the searing agony of watching loved ones sicken and suffer and die from corporate-caused cancers.

In this case I am writing on three sections of the Philly Refinery "cleanup" AOI 1-11, Lead Report, Outreach Plan: Process Comments, Issue Comments, and Unaddressed issues.

Community Outreach Plan:
- Evergreen has refused to provide a remotely adequate Public Involvement Process.
- The community needs much more time and many more public meetings--in the time of Covid, even more so.
- Act 2 requirements are not adequate. Evergreen must do more.
- No air quality data have been collected at contaminated sites or in surrounding neighborhoods. This is unacceptable.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a

decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Date: Monday, January 11, 2021 11:30:23 PM

Evergreen Resources,

As a current Philadelphia resident I can attest from a practical standpoint of exposure and observation to the obvious lack of diligence in considering the safety standards put forth in this process:

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:

- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Evergreen Resources,

Greetings,

There are 3 sections of comments I'd like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide "meaningful public involvement" in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a "site-specific lead standard" of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, "water table" aquifer from a lower, "deep" aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop

appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Evergreen Resources,

The site of the former South Philadelphia oil refinery needs to be cleaned up in an environmentally sound and ethically responsible way to reduce harm to current and future generations, and to ensure least damage to the environment and human/animal life.
Please see my concerns included below with the currently publicized information concerning the clean up:
Sincerely,
Samantha Mayer

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to

protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Monday, January 11, 2021 11:04:31 PM

Evergreen Resources,

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. This follows a tradition of environmentally damaging actors who tout community engagement, while doing the bare minimum to clean up after their messes.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations. This grossly undervalued the damage they have levied against the surrounding community. To truly amend the magnitude of that damage, Evergreen must survey through whatever available means the environmental impact to the surrounding community.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information

has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Monday, January 11, 2021 9:55:34 AM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Will Fraser

Evergreen Resources,

I want everything below and I want each of us to imagine our responsibility to the earth and our communities. If we can't understand that healing is only as effective as how far it spreads we will be overcome with greed and waste. Let this community breath
There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide "meaningful public involvement" in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a "site-specific lead standard" of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, "water table" aquifer from a lower, "deep" aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:

- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Date: Monday, January 11, 2021 9:57:50 AM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM. This unacceptable to the community and our concerns must be heard and addressed.
- Benzene - High levels of benzene are present extensively at the site, and benzene, which is recognized as a carcinogen, is currently being emitted into the atmosphere. The assessment of its potential effects on the community must be assessed during worst-case scenario, i.e., when the region is experiencing a summer temperature inversion and the air remains stagnant for days at a time, not during average atmospheric conditions.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- It is highly likely that the fire-fighting agents containing PFAS were used on the site and their presence needs to be assessed.
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

To:	Philly Refinery Cleanup
Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Monday, January 11, 2021 5:25:48 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Aseel Rasheed

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Monday, January 11, 2021 8:22:48 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Tuesday, January 12, 2021 9:11:19 PM

Dear phillyrefinerycleanup.info,

I am writing on behalf of the Philadelphia Chapter of Pennsylvania Interfaith Power & Light, people of faith concerned about climate change as a moral issue. We were involved in the movement to close the refinery and are very glad that it will no longer be a fossil-fuel production site.

However, the clean up must be thorough if we are to live out our call to be good stewards of the environment and just to the nearby community which bore the brunt of the refinery's pollution. Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site is not sufficient. We strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, any plan that does not take into account the effects of climate change is not reality based. It shirks our responsibility to future generations. We ask that Evergreen rewrite the proposal to take into account rising sea levels, more intense storms, and other climate-related factors.

We understand that over 100 years of refining oil has caused great damage to the site. But now is not a time to cut corners. It is time to take care, to think about the future, and to do what is needed so that the site will be life-supporting for all of Philadelphia for years to come. Thank you.

Sincerely,
Cheryl Pyrch

Comment

To Whom It May Concern,

My name is Indi Williams and I am a high school student in Philadelphia. I am in the 10th grade and I live in a nice neighborhood. I am writing you this letter in regards to the AOI 1-11, Lead Human Health Risk Assessment Report.
Specifically, I would like to share with you my hope and concerns about this plan to remediate pollution at the former refinery site.
I would like to begin by sharing my hope, I hope you guys fix the problems with the refinery. I hope this occurs because the refinery is giving off pollutants that are harmful to civilians around the area.
Unfortunately, there a few things that I am concerned with as well, including pollutants and waste dumping. I'm worried about lead because it can cause drastic health effects, such as increased blood pressure, weakness in the ankles, and brain damage.
Another concern I have is about benzene because it causes confusion, tremors, rapid heart rate, and convulsions.
Thank you for taking the time to read my comments. Recently, I learned a lot about the D.E.P, so I will leave you with this quote " Hilco seems to opting for the cheapest remediation methods not the best one ".
Best Regards,
Indi Williams

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Report

Philadelphia Refinery_AOI 8 RIR_12-21-17

Comment

This comment regards the benzene groundwater contamination on the Verizon SDWC property and subsequent properties. There does not seem to be sufficient sampling points located on the properties to the north of N-3 or west of V-MW-9 to accurately estimate the true extent of the plume. Similarly there appears to be insufficient data points to the north east of V-MW-16 on the north part of the Verizon SDWC property to properly determine a contaminant boundary . Was subsequent sampling and monitoring performed alongside I-76 or on the other side of the highway near the Philadelphia Housing Authority building to further delineate offsite impacts? Water level gradients seem to indicate slight a NE flow off of the Verizon SDWC that this report did not consider or investigate

In addition the pump-and-treat system along Maiden Ln does not look like it changes the gradient of the plume that extends to the Verizon SDWC property and beyond. What is being done to properly delineate and mitigate this off-site benzene issue?

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Tuesday, January 12, 2021 7:44:36 PM

Dear phillyrefinerycleanup.info,

Evergeen must use the highest standards for cleaning up this site.

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
lalur Lane

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Tuesday, January 12, 2021 10:31:24 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

As a concerned citizen and member of the healthcare community I recognize that there are drastic effects on the health of those in this community from this incident and I hope that measures can be taken to further public safety.

RE: Please strengthen cleanup plan for PES refinery

Dear ,

Dear Evergreen Resources,

I'm writing to call on you to strengthen the proposed cleanup and remediation plan for the South Philadelphia PES refinery site.

Specifically, I call on you to:
- Strengthen remediation standards for lead to mirror Pennsylvania's statewide standards for cleanup;
- Set standards for PFAS contaminants that may be found at the site;
- Address concerns about migration of contaminants that could pollute drinking water sources for New Jersey residents;
- Include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Thank you in advance for including these criteria, and I look forward to hearing your response.

Sincerely,
Mr. Barry Weiss

Comment

To Whom It May Concern,

My name is Brandon Head and I am a high school student in Philadelphia. I am in the 10th grade and live in East Falls neighborhood. I am writing you this letter in regards to the AOI 1-11, Lead Human Health Risk Assessment Report.

Specifically, I would like to share with you my hope and concerns about this plan to remediate pollution at the former refinery site..

I would like to begin by sharing my hope. I hope that the refinery will have a great clean up team. I hope this occurs because the neighborhoods would like for this to be clean the right way.

Unfortunately, there are a few things that I am concerned with as well, including recycling the debris and where are they going to take it? I'm worried about Hydrofluoric acid or HF because if it gets into the neighborhood and someone throws a cigarette and it hits it, the whole neighborhood will blow up causing massive casualties.

Another concern I have is about Butane because this is the second large chemical in there this is lighter fluid and if it's the right pressure and temperature then this will blow up also, this was the gas that blow up in the first place and if this was in a neighborhood it would be like a nuclear bomb exploded.

Thank you for taking the time to read my comments. Recently, I learned a lot about Robert Brady , so I will leave you with this quote, "Three quarters of the East Coast's refinery capability is located in the Philadelphia region."

Best Regards,
Brandon Head

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

We the people demand a safe environment to live in. Unless this site is cleaned up to PA health levels this safe environment for the people cannot be achieved.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Tuesday, January 12, 2021 6:04:34 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

RE: Please strengthen cleanup plan for PES refinery

Dear ,

Dear Evergreen Resources,

I'm writing to call on you to strengthen the proposed cleanup and remediation plan for the South Philadelphia PES refinery site.

Specifically, I call on you to:
- Strengthen remediation standards for lead to mirror Pennsylvania's statewide standards for cleanup;
- Set standards for PFAS contaminants that may be found at the site;
- Address concerns about migration of contaminants that could pollute drinking water sources for New Jersey residents;
- Include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Thank you in advance for including these criteria, and I look forward to hearing your response.

Sincerely,
Mr. Chris Spencer

From:	Eleanor Dill
To:	Philly Refinery Cleanup
Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Tuesday, January 12, 2021 1:11:51 PM

Dear phillyrefinerycleanup.info,

As a former Environmental Public Health employee, I am shocked that Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes. This community has been over-exposed far to long.

Sincerely,
Eleanor Dill

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Tuesday, January 12, 2021 12:09:30 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

To: Philly Refinery Cleanup
Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Tuesday, January 12, 2021 5:31:06 PM

Evergreen Resources,

I'd like to submit comments dealing with three matters related to the refinery clean-up: process comments, issue comments, and unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide "meaningful public involvement" in the Act 2 processes. The Public Involvement Process is inadequate.
- Evergreen has not given the community enough time to understand and consider all of the information. 120 days is insufficient.
- Evergreen has not actually addressed community concerns in ways that are relevant to the community
- Air quality was tested inside existing buildings, but NOT in surrounding neighborhoods or onsite at contaminated locations

Comments on Contaminants of Concern:
- Lead - high levels of lead appear in multiple locations. PADEP is letting Evergreen use a "site-specific lead standard" of 2240 PPM, but the statewide health limit is under half that, 1000 PPM
- Benzene - benzene is both present in high levels at the site and being emitted into the atmosphere
- MBTE - Methyl Tert-butyl Ether (MTBE) is present at concentrations over 100x higher than the state-wide health standard
- 30 contaminants of concern were identified individually, but they are not present individually, they are present together. What is their cumulative effect? If that wasn't determined, why not?
- The refinery used more than those 30 chemical compounds. Why were only those 30 sampled? If it is believed that other compounds are safe, what happens if we ignore their presence now and then future research shows they were dangerous?
- Deep Aquifer - Evergreen says that the "water table" and "deep aquifer" are separated by clay and mud, but that barrier isn't continuous or impregnable, so Evergreen needs to say what it will do to investigate and fix any contamination that crosses into the aquifer which supplies drinking water in New Jersey

Comments on Unaddressed Issues
- Current conditions - Some of the data is from over a decade ago
- Off-site contamination - Benzene pools exist beyond the property line, but Evergreen has not mapped or acknowledged any responsibility for contaminants that originated inside the site but extend outside it
- Water treatment - there isn't enough information about the current contamination conditions

or why Hilco's plans to replace the systems are appropriate or what they are
- PFAS - Fire fighting and training exercises have released PFAS ("forever carcinogens") at the site. Evergreen needs to sample for PFAS and include them in plans for remediation.

RE: Please strengthen cleanup plan for PES refinery

Dear ,

Dear Evergreen Resources,

I'm writing to call on you to strengthen the proposed cleanup and remediation plan for the South Philadelphia PES refinery site.

Specifically, I call on you to:
- Strengthen remediation standards for lead to mirror Pennsylvania's statewide standards for cleanup;
- Set standards for PFAS contaminants that may be found at the site;
- Address concerns about migration of contaminants that could pollute drinking water sources for New Jersey residents;
- Include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Thank you in advance for including these criteria, and I look forward to hearing your response.

Sincerely,
Mr. Homer Robinson

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Tuesday, January 12, 2021 6:17:05 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Comment

To Whom It May Concern,

My name is Jocelyn E. and I am a high school student in Philadelphia. I am in the 10th grade and live in a North West Philly neighborhood. I am writing you this letter in regards to the AOI 1-11, Lead Human Health Risk Assessment Report.

Specifically, I would like to share with you my hope and concerns about this plan to remediate pollution at the former refinery site..

I would like to begin by sharing my hope. I hope that less Refineries are put in Philadelphia . I hope this occurs because people tend to put more refineries and factories etc in cities with less fortunate people and also discriminate because of the color of our skin (black and brown people).
Unfortunately, there are a few things that I am concerned with as well, including pollution and chemicals. I'm worried about hydrochloric acid because if hydrochloric acid gas in the air is 0.035%, Humans can have pain in their throat and chest which can cause trouble breathing within 10 minutes.
Another concern I have is about nickel carbonyl because nickel carbonyl is very toxic and can cause chronic bronchitis, reduced lung function, and lung and nasal cancer if breathed in.
Thank you for taking the time to read my comments. Recently, I learned a lot about Tyrone Hayes, so I will leave you with this quote, "The secret to a happy, successful life of paranoia is to keep careful track of your persecutors ."

Thank You,
Jocelyn Eaton

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Tuesday, January 12, 2021 12:01:12 AM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Evergreen Resources -- Philly Refinery Cleanup
P.O. Box 7275
Wilmington, DE 19083
US

RE: Please strengthen cleanup plan for PES refinery

Dear ,

Dear Evergreen Resources,

I'm writing to call on you to strengthen the proposed cleanup and remediation plan for the South Philadelphia PES refinery site.

Specifically, I call on you to:
- Strengthen remediation standards for lead to mirror Pennsylvania's statewide standards for cleanup;
- Set standards for PFAS contaminants that may be found at the site;
- Address concerns about migration of contaminants that could pollute drinking water sources for New Jersey residents;
- Include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Thank you in advance for including these criteria, and I look forward to hearing your response.

Sincerely,
Mr. Mark Barbash

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Date: Tuesday, January 12, 2021 3:47:14 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

RE: Please strengthen cleanup plan for PES refinery

Dear ,

Dear Evergreen Resources,

I'm writing to call on you to strengthen the proposed cleanup and remediation plan for the South Philadelphia PES refinery site.

Specifically, I call on you to:
- Strengthen remediation standards for lead to mirror Pennsylvania's statewide standards for cleanup;
- Set standards for PFAS contaminants that may be found at the site;
- Address concerns about migration of contaminants that could pollute drinking water sources for New Jersey residents;
- Include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Thank you in advance for including these criteria, and I look forward to hearing your response.

Sincerely,
Ms. Merrily Williams

But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

We the people demand a safe environment to live in. Without the complete clean up of this site, we can not have that right to a safe and healthy life or future.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Tuesday, January 12, 2021 5:38:59 PM

Evergreen Resources,

My name is Nipun Kottage and I moved to Philadelphia to attend medical school. During my brief time here I have become increasingly concerned about Hilco and Evergreen's plan to develop the PES Refinery Site responsibly and equitably. Please find copied below details of my concerns. Importantly, I believe that Hilco must provide up-to-date, factually correct, and timely information about the status of the site's pollution and the harm pollutants at the site (past, present, and future) and inflicting upon neighboring communities. Currently the burden of asthma and cancer around the site suggest that there are significant health risks that need to be remediated and addressed by Hilco. This solution must include more time for public comment and collaborative and meaningful engagement with residents of neighboring communities impacted by legacy contamination and who will be affected by development.

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of

these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

RE: Please strengthen cleanup plan for PES refinery

Dear ,

Dear Evergreen Resources,

I'm writing to call on you to strengthen the proposed cleanup and remediation plan for the South Philadelphia PES refinery site.

Specifically, I call on you to:
- Strengthen remediation standards for lead to mirror Pennsylvania's statewide standards for cleanup;
- Set standards for PFAS contaminants that may be found at the site;
- Address concerns about migration of contaminants that could pollute drinking water sources for New Jersey residents;
- Include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Thank you in advance for including these criteria, and I look forward to hearing your response.

Sincerely,
Mr. Peter Hecht

Comment

To Whom It May Concern,

My name is Ramiyah Wilson and I am a high school student in Philadelphia. I am in the 10th grade and live in the Northeast neighborhood. I am writing you this letter in regards to the AOI 1-11, Lead Human Health Risk Assessment Report.

Specifically, I would like to share with you my hope and concerns about this plan to remediate pollution at the former refinery site..

I would like to begin by sharing my hope. I hope that it's used in a good way and cleaned right because we don't need those remaining chemicals still there affecting people. I hope this occurs because people of color make up 30% of the US population and 65% of the population living in neighborhoods with factories that leave toxic chemicals and I feel like it happened once with the Philadelphia Refinery blowing up before leaving chemicals in the air wasn't really good and we don't need a repeat.

Unfortunately, there are a few things that I am concerned with as well, including there still may be toxins left in the soil or just lying around and people can be harmed and make life-changing choices. and they may not really care about our health, they just want money. Also whoever cleans it up may become lazy and not properly clean it up. I'm worried about benzene because when the Refinery got caught on fire this one of the major chemicals released and it left five people severely harmed and we don't want that again

Another concern I have is about lead being released because this was another major chemical that we were breathing in back in 2019 when the fire happened and I just want it to be safe for all workers and cleaners.
Thank you for taking the time to read my comments. Recently, I learned a lot about Majora Carter, so I will leave you with this quote, " If we are going to be part of the solution, we have to engage the problems ."

Best Regards,
Ramiyah Wilson

- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

RE: Please strengthen cleanup plan for PES refinery

Dear ,

Dear Evergreen Resources,

I'm writing to call on you to strengthen the proposed cleanup and remediation plan for the South Philadelphia PES refinery site.

Specifically, I call on you to:
- Strengthen remediation standards for lead to mirror Pennsylvania's statewide standards for cleanup;
- Set standards for PFAS contaminants that may be found at the site;
- Address concerns about migration of contaminants that could pollute drinking water sources for New Jersey residents;
- Include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Thank you in advance for including these criteria, and I look forward to hearing your response.

Sincerely,
Ms. Sheila Siegel

- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Tuesday, January 12, 2021 11:48:47 AM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Comment

To Whom It May Concern,

My name is Trinity Autumn Clark and I am a high school student in Philadelphia. I am in the 10th grade and live in North Philadelphia/East Falls neighborhood. I am writing you this letter in regards to the AOI 1-11, Lead Human Health Risk Assessment Report.

Specifically, I would like to share with you my hope and concerns about this plan to remediate pollution at the former refinery site..

I would like to begin by sharing my hope. I hope that the people that live in areas exposed to the refinery are relocated. I hope this occurs because There were incidents in places like New Orleans that led people exposed to chemicals set off by refineries to have respiratory and immune issues. A pipe leak even led a boy and older woman to death by an explosion who lived near the place.

Unfortunately, there are a few things that I am concerned with as well, including The explosion and dangerous chemical reactions. I'm worried about hydrofluoric Acid because it was proved to form toxic clouds that could cause severe health problems like chronic lung disease, and lead to death to people exposed to it long term.

Another concern I have is about Benzene because it can cause red blood cells to decrease, which can cause people to develop anemia.

Thank you for taking the time to read my comments. Recently, I learned a lot about Margie Eugene-Richard, so I will leave you with this quote, " We must do everything to improve human life, environmental issues should never be ignored."

Thank you,
Trinity A. Clark

RE: Please strengthen cleanup plan for PES refinery

Dear ,

Dear Evergreen Resources,

I'm writing to call on you to strengthen the proposed cleanup and remediation plan for the South Philadelphia PES refinery site.

Specifically, I call on you to:
- Strengthen remediation standards for lead to mirror Pennsylvania's statewide standards for cleanup;
- Set standards for PFAS contaminants that may be found at the site;
- Address concerns about migration of contaminants that could pollute drinking water sources for New Jersey residents;
- Include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Thank you in advance for including these criteria, and I look forward to hearing your response.

Sincerely,
Mr. Vic Compher Compher

From:	Aaron Bauman
To:	Philly Refinery Cleanup
Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 8:44:44 AM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Aaron Bauman

- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Wednesday, January 13, 2021 9:34:12 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 7:18:38 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Ann Dixon

I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Britt Faulstick

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Finally, it is my understanding that Evergreen has not conducted any sampling of the deep aquifer which supports sources of drinking water for New Jersey. Evergreen should expand their investigation to more thoroughly consider the potential for off-site groundwater contamination and the impacts on neighboring communities not limited to Philadelphia County.

Please take these comments seriously and make the necessary changes.

Sincerely,
Catherine Ellenberg

To: Philly Refinery Cleanup
Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Wednesday, January 13, 2021 5:19:52 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Wednesday, January 13, 2021 1:31:38 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 4:21:54 PM

Dear phillyrefinerycleanup.info,

Make good on your promise to safely repair this scar in our city

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Elizabeth Hamann

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

I am writing to express concern about the level of investigation, reporting and public conversation about site contamination and clean up of the PES refinery site.

Evergreen should demonstrate that it is open to partnership with the public to prepare for the future of this site. This could be achieved by holding small-group meetings to allow for meaningful public engagement throughout the Act 2 process, and by creating a community-based advisory group to solicit questions and comments from the residents and businesses in the area.

I have reviewed Evergreen reports and attended public meetings along with many other concerned citizens. After exploring the materials at length, and attending meetings, many engaged Philadelphia residents don't agree that you are offering access to materials that facilitate public conversation about appropriate clean up measures. Delivering 1000-page documents for comment is not democratic. Your reports can easily be designed to make key data and decisions accessible to the public.

Creating living documents that update the state of knowledge about contamination, and incorporate public comment, will make for authentic public conversation about the future of this incredibly important place in our city. The recent NYT article about PES and Philly Thrive shows that the world is watching how we do this.

Many communities and cities are finding that COVID 19 doesn't have to stifle public debate. The South Philadelphia and Grays Ferry communities are comfortable with virtual tools that allow us to see and hear each other, as well as Evergreen. It is important that you adopt tools (which you likely use in your daily meetings with colleagues) that promote a true virtual public meeting.

Evergreen information sessions offer a strong basic primer on geology, groundwater and characterization of the contamination readings, and the presenters are very good at explaining things. Many engaged community members have already studied this material together, and with a variety of other subject matter experts, and are ready to move on to learning more about the key decisions being made now (or soon) about contamination management and clean up. Similarly, at the recent meeting held by SKEO and EPA, representatives were resistant to answering public questions beyond the scope of the TASC report. Limiting what information

will be given to the public to arbitrarily defined packages does not support “meaningful engagement” or transparency as defined by the law. I agree with other suggestions that Evergreen and others focus future discussion on critical paths for decisionmaking about management of risks to adjacent communities and the ecological future of the site.

It is important that public agencies at the state and city level ask more of Evergreen. Basic reporting, as required by state law, is not sufficient for this site. PFAS, for example, are likely highly concentrated here due to firefighting on site. I support the specific reporting measures recommended by the Clean Air Council in Mr. Minott’s op ed in The Inquirer this morning (January 13). This would be a big step forward.

Thank you for your attention to these concerns.

Date: Wednesday, January 13, 2021 7:31:31 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 5:03:26 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Jaime Wouters

Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

The current work cannot be evaluated until all analysis about the aquifers is completed. Without that information, the public does not have all of the information to evaluate decisions on soil and groundwater sampling.

- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 10:14:34 PM

Dear phillyrefinerycleanup.info,

As a Philadelphia resident and concerned citizen, I've been disturbed and frustrated to learn about the former PES refinery site and the legacy of toxins and pollutants it has left on the environmental justice community that surrounds the refinery. The opportunity to clean up and redevelop the refinery is a once in a lifetime chance to repair the biggest blight of our region. And as greenhouse gas emissions continue to rise and we know sea level rise, storm surge and precipitation events will continue to worsen. Evergreen must ensure its remedial investigation adequately addresses these future climate change conditions. For the +150 years this community has suffered from the presence of this refinery, we owe it to this community to ensure their health will be protected once this site is finally cleaned up.

Sincerely,
Korin Tangtrakul

From:	Lauren Duhigg
To:	Philly Refinery Cleanup
Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 5:02:26 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Lauren Duhigg

Date: Wednesday, January 13, 2021 4:18:09 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

To: Philly Refinery Cleanup
Subject: Comments on Legacy Contamination RIRs
Date: Wednesday, January 13, 2021 9:36:20 PM
Importance: High

To Evergreen and PA DEP:

I worked in environmental quality, including in air and groundwater quality and with sites requiring major remediation for a decade, and have studied the RIRs in detail from that perspective. I am writing to state that the RIRs presented are so flawed that even those that were previously approved by DEP (without adequate public review) need to be rejected, improved significantly at least as described below and in other's detailed comments, and then resubmitted for public review and comment before they are used to develop long-term remediation plans. It is not necessary to stop ongoing remediation, but future remediation should not be limited by using incomplete and potentially inaccurate data.

*The site-specific clean up standard for lead needs to be withdrawn and replaced with a mandate to clean up the site and lead-polluted areas outside the property to a health-based standard. I'll defer to the Clean Air Council and health experts for the specifics on the number, but although it might be cheaper and easier to leave a high level of lead on and near the site, the site-specific standard not only does not protect human health, but it reduces the number of places that Evergreen needs to remediate any lead. That is, the "site-specific standard" would allow SUNOCO to legally leave dangerous lead contamination in place, continuing to imperil the lives of people who live and work at or near the site and leaving the area as a permanently polluted area unfit for human habitation. This is completely unacceptable. There are also high concentrations of lead in soil near areas where the groundwater aquifer is very shallow, and leaving this lead would potentially end up contaminating the groundwater and eventually the unconfined drinking water aquifer. This risk of not cleaning it up to at least a health-based standard is too high to allow.

*The data in these reports was mostly collected between 2011 and 2017, and are too old to be trusted to reflect the current conditions and contaminants in all areas. The amount of time passed, the additional pollution from several years of refinery operation and fires, and the heavy rainfall that the area has received in the past decade all probably resulted in changes or movement of some or all contaminants, including moving more off-site and into the lower aquifer. New sampling needs to be conducted in all areas, on land and in water, to both verify actual conditions and contaminants and to test for contamination that was not tested for at all (like PFAS compounds), and to test some areas, like both shallow and deep portions of the aquifer, more thoroughly. As new sampling is done, if it becomes apparent that the old "edges" of contamination have moved, the sampling areas need to be enlarged until new "edges" are well-established.

*30 contaminants were tested for. How was it determined which compounds to test for and which compounds to not look for? The lack of information on how potential contaminants were chosen or rejected for testing undermines trust in the objectivity and completion of the data.

*All areas that were not tested (example—close to the refinery facilities) need to be thoroughly

tested now and the results need to be released to the public for review and comment. This new data, any other data that has already been collected but are not reflected in the RIRs, as well as data from sampling for additional compounds and to verify or replace previous sampling, need to be collated into updated RIRs for all areas, which then need to be reopened for public review and comment BEFORE the RIRs are considered final or used as the basis for final remediation plans.

*Groundwater needs more attention and testing as well as soil. For one thing, an update is needed to reflect the conditions of both shallow and deep groundwater because of the length of time since the reported sampling, and after years of partial remediation. Contamination in groundwater aquifers does not stay in one place for years! I'm also concerned that the shallow and deep aquifers were presented as being separated by an aquitard, implying that the deeper drinking water aquifer was somehow protected from the high pollution in the more shallow areas. However, the shallow and deep aquifers are not continuously separated, leaving contamination to migrate between them. This is even more concerning since some shallow areas of the aquifer are very close to highly contaminated soil and thus very vulnerable to becoming more contaminated over time. Also, while pumping contamination out of the water has removed a lot of pollution, pumping also alters how quickly and in what direction groundwater (and contamination) moves, and may have increased the movement of contamination between these unconfined aquifers or how far from the refinery the contamination extends. Because of this, it would be prudent to conduct new tests as well as sampling a larger portion of both aquifers.

*Please remember that this aquifer supplies drinking water to NJ, and extend testing into NJ. While it is fortunate that Philadelphians do not use the aquifer for drinking water, that does not release Evergreen from cleaning it to drinking water standards.

*Most of the testing in all media was limited to the industrial site or very close to it. Since contamination from air pollution occurred continuously outside the site, since most contamination migrates and may change over time, depending on many factors, more extensive offsite testing for all compounds should be done.

*More testing for lead, benzene and other VOCs should be conducted in especially residential areas to protect public health. While initial ambient air testing was done within buildings *on the site*, this should be extended to testing basements in residential areas near VOC/benzene pollution for levels of ambient air contamination from these compounds. Even without fresh pollution coming in through their windows, people may be living in homes with unhealthy ambient air quality due to volatile compounds coming through their basement walls.

*Although the sources of benzene are disputed in the reports, the fact remains that benzene is a carcinogen and that at least some of it probably came from the refinery site. After the current extent of it is better established, it needs to be removed, both onsite and offsite even if Evergreen needs to enter into another agreement with another responsible party to do so. It is not acceptable, even if SUNOCO only created some of it, for Evergreen to "clean up" this site and leave a dangerous carcinogen because it wasn't "their problem".

*I realize that Evergreen is only "responsible" to identify and clean up the "Legacy pollution".

However, it is impossible to develop adequate remediation plans for any of the site without considering the current conditions at the site. More money and time would be wasted "cleaning up" an area using outdated, incomplete or inaccurate data than developing better, more recent and complete data and maybe removing some contamination that was not Evergreen's "responsibility".

Thank you.

Subject: South Philly refinery cleanup
Date: Wednesday, January 13, 2021 10:41:11 AM

Dear Sir/Madam:

As a resident of South Philadelphia, I demand a thorough, accurate and complete investigation of environmental contamination at the former Philadelphia Energy Solutions refinery in South Philadelphia. The investigation should identify contamination so that the refinery site can be properly remediated. The investigation should include PFA's, impact on climate change, the evaluation of the steel wall and how humans could potentially be exposed to pollutants from the site through groundwater. I further demand that the DEP and Evergreen make public health a top priority during the cleanup of this site.

Sincerely

Lisa McCaffrey

Evergreen Resources,

I lived in West Philadelphia for three years and often visited South Philadelphia during that time. I am extremely concerned about the impacts of pollution and the climate crisis on South Philadelphia communities. They are already suffering adverse health impacts like cancer and asthma from the inadequate cleanup after the 2019 oil refinery explosion.

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 7:35:46 AM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Mary Ambros

Subject:	Remediating the Former Philadelphia Refinery
Date:	Wednesday, January 13, 2021 9:17:51 PM

I would like to thank the Evergreen group for taking up the monumental task of cleaning up the refinery. I am encouraged that this work is underway and urge Evergreen to address more thoroughly the concerns brought up by many scientists and environmentalists regarding the cleanup at the former refinery site. For example:
1) Evergreen's proposed lead standards for surface soil are not in line with current science or with the governor's Lead Free PA initiative. Allowing the PES site to apply a lead standard that is twice the current value for non-residential soil (as well as the proposed revised one in the suggested update to the PA Dept of Environmental Protection regulations), and four times higher than the one required for soils that are near groundwater (as some of the site is) does not agree with these goals.
2) The PA Dept of Environmental Protection has added Per- and polyfluoroalkyl substances (PFAS) to the recent regulations for contaminants—likely present in refineries, since they are used in firefighting foams. Indeed, other states such as Alaska, Michigan, Colorado and Wisconsin found PFAS contamination in refineries, and are requiring or undergoing remediation of those sites. The site should be tested for these contaminants and required to address the contamination.
3) Evergreen needs to revise its remedial investigation reports to conform both with evolving scientific knowledge AND with the evolving state of our world due (at least in part) to changes brought on by climate change.
The reluctance to address changing standards is understandable. However, when dealing with a situation brought on by lax oversight in the first place, there is no excuse for lack of a full and thorough consideration of current scientific knowledge. Evergreen cannot operate under outdated rules or behind the times!
Evergreen's mission is too important. In the words of Pope Francis:

> There is a growing jurisprudence dealing with the reduction of pollution by business activities. But political and institutional frameworks do not exist simply to avoid bad practice, but also to promote best practice, to stimulate creativity in seeking new solutions and to encourage individual or group initiatives.
>
> - *Laudato Si (177)*

I sincerely hope Evergreen will do the right thing and be part of the solution for all of us.

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg.

We just moved down here to south philly, are planning to be married this weekend and start a family. However, it's come to my attention the issues with this refinery clean up that negatively impact the health of my future family.

Should I stay and risk this? I dunno, but a thorough analysis of the site will go a long way to assuage resident concerns and protect the growth of philly's tax base, ya know?

Sincerely,
Nathan Fried

- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 5:39:02 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Nathaniel Philip

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Wednesday, January 13, 2021 11:08:25 AM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 7:07:42 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Patrick Danas

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

RE: Please strengthen cleanup plan for PES refinery

Dear ,

Dear Evergreen Resources,

I'm writing to call on you to strengthen the proposed cleanup and remediation plan for the South Philadelphia PES refinery site.

Specifically, I call on you to:
- Strengthen remediation standards for lead to mirror Pennsylvania's statewide standards for cleanup;
- Set standards for PFAS contaminants that may be found at the site;
- Address concerns about migration of contaminants that could pollute drinking water sources for New Jersey residents;
- Include research about the threat posed by rising sea level and extreme weather events that could be triggered by climate change.

Thank you in advance for including these criteria, and I look forward to hearing your response.

Sincerely,
Dr. Robert DuPlessis

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 10:27:13 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Roxanne Trachtenberg

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 10:48:01 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes in the interest of public health.

Sincerely,
Sara Labrum

To:	Philly Refinery Cleanup
Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 9:38:24 AM

Dear phillyrefinerycleanup.info,

Philadelphia residents and workers deserve an updated and accurate investigation into the environmental safety hazards at the former refinery site.

Evergreen completed its remedial investigation reports over three years ago. Given the fire incidents and other changes during that time, relying on older data seems questionable. Evergreen should provide evidence that data from these reports are still representative.

Evergreen has proposed a site-specific standard for surface soil lead levels (2,240 mg/kg). This is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen should be using the current science to set a site-specific standard that protects public health.

Given the expected rise in water levels along the Schuylkill, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. I'm particularly concerned about the migration of contaminants in the soil and groundwater.

I hope you'll take these concerns into account.

Sincerely,
Sarah Elichko

From: Sheila Tripathy
To: Philly Refinery Cleanup
Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Wednesday, January 13, 2021 12:52:50 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Please take these comments seriously and make the necessary changes.

As an environmental attorney, I am astounded that the DEP would even consider lead levels this high given what we are seeing in Detroit. We are doing the right thing by cleaning this up but do it the right way and protect our residents, future residents and our environment.

Sincerely,
Stuart Claire

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Wednesday, January 13, 2021 6:19:06 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Taylor Sexton

Comment

To Whom It May Concern,

My name is _Alissya Flood-Mayzck and I am a high school student in Philadelphia. I am in the 10th grade and live in Fern rock_ neighborhood. I am writing you this letter in regards to the AOI 1-11, Lead Human Health Risk Assessment Report.

Specifically, I would like to share with you my hope and concerns about this plan to remediate pollution at the former refinery site..

I would like to begin by sharing my hope. I hope that human health can increase in a positive matter_. I hope this occurs because the environment risks are high_.

Unfortunately, there are a few things that I am concerned with as well, including my neighborhood_ and family. I'm worried about air pollution _ because its causing us humans to increase the chances of lung cancer, heart diseases, and respiratory diseases

Another concern I have is about oil refinery because its is also increasing the chances of the following;

Thank you for taking the time to read my comments. Recently, I learned a lot about mari copeny, so I will leave you with this quote, "We need to protect dreamers ."

Thank you_ ,
Alissya Flood-Mayzck

- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop

appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Thursday, January 14, 2021 12:12:56 PM

Evergreen Resources,

As a medical student soon to graduate and become a physician this Spring, I know the impact environmental toxins have on communities and that this impact disproportionately affects communities of color. This is racism in action and I won't stand for it.

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide "meaningful public involvement" in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a "site-specific lead standard" of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, "water table" aquifer from a lower, "deep" aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:

- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Thursday, January 14, 2021 2:17:04 PM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Bria Feaster

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Thursday, January 14, 2021 3:54:43 PM

Evergreen Resources,

I am writing as a neighbor in West Philadelphia. I am deeply concerned with a number of aspects of the remediation reports. In particular, I would like to highlight the lack of appropriate consideration given to the inevitable sea-level rise affecting the tidal Delaware and Schuylkill Rivers, and how this site condition will affect the propensity for existing known contaminants to be released into the surrounding areas.

I would like to make it clear that I am in full support of Philly Thrive's efforts, and I believe that they represent my concerns with the remediation reports and plans.

For that reason, I am including below a full accounting of the specific areas of concern, which I am sure are being submitted by many others. It is essential that Evergreen and the DEP gets this right the first time.

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.

- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Evergreen Resources,

Article I, Section 27 of the Pennsylvania Constitution states: “THE PEOPLE HAVE A RIGHT TO CLEAN AIR, PURE WATER, AND TO THE PRESERVATION OF THE NATURAL, SCENIC, HISTORIC, AND ESTHETIC VALUES OF THE ENVIRONMENT. PENNSYLVANIA'S PUBLIC NATURAL RESOURCES ARE THE COMMON PROPERTY OF ALL THE PEOPLE, INCLUDING GENERATIONS YET TO COME. AS TRUSTEE OF THESE RESOURCES, THE COMMONWEALTH SHALL CONSERVE AND MAINTAIN THEM FOR THE BENEFIT OF ALL THE PEOPLE.“

This overrides any action by SUNOCO, Evergreen, HILCO, PA DEP, and the EPA. How will the cleanup meet this requirement?

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Thursday, January 14, 2021 7:27:02 AM

Evergreen Resources,

I am a concerned resident. There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

To:	Philly Refinery Cleanup
Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Thursday, January 14, 2021 11:00:55 AM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Elliot Lipeles

Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Thursday, January 14, 2021 11:42:46 AM

Dear phillyrefinerycleanup.info,

Evergreen's proposed site-specific standard for lead in surface soil at the former refinery site will not be protective of public health. I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
George Claflen

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Thursday, January 14, 2021 2:36:07 PM

Evergreen Resources,

Hi there! There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

You gotta do better with this jawn

From:	John Lehman
To:	Philly Refinery Cleanup
Subject:	Comment on the Site-Specific Standard for Lead and Remedial Investigation Reports for the Former Refinery Site
Date:	Thursday, January 14, 2021 4:30:34 PM

Dear phillyrefinerycleanup.info,

As a resident of southwest center city for over 30 years, raising a family, and looking forward to future other families in these neighborhoods, a full and accurate site analysis and thorough remediation is vitally important before the refinery site is left for posterity.

While I recognize the century-long industrial use and the benefits of lesser environmental standards for brown-field development of such sites, several issues have been neglected thus far:
1) reportedly, the site-wide analysis has not included PFAS chemicals, well known as toxic;
2) potential groundwater pollution, whether shallow or deep, has not been fully investigated, and obviously, the migration characteristics of groundwater and its drinking water use makes a complete investigation vital;
3) Potential site pollutant migration into the Schuylkill River must be fully evaluated;
4) Accepting lead soil contamination at a level twice that of the Pennsylvania state nonresidential standard would be criminal.
5) Future pollutant spread through projected sea level rise must also be evaluated and addressed.

Now is the time to execute the remediation of the site thoroughly for the health of future Philadelphians, Pennsylvanians, and even New Jerseyans.
Respectfully,
John T. Lehman
Philadelphia

Sincerely,
John Lehman

Evergreen Resources,

Good afternoon,
My name is Julia Tackett; I am a constituent from Philadelphia. It is imperative that the refinery site in South Philadelphia be remediated and contained in a SAFE and EQUITABLE manner. The residents around this site have been marginalized and taken advantage of for far too long.

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.

I strongly urge you to withdraw the proposal to set a site-specific standard of 2,240 mg/kg. Evergreen's proposed site-specific standard is more than twice the direct contact numeric value in state regulations (1,000 mg/kg). Evergreen made a flawed assumption about the target blood lead level to adequately protect a fetus of a worker at the site -- an important factor in determining the site-specific standard for lead. It used a level that is twice the reference value that the Centers for Disease Control and Prevention uses to address lead exposure in children. Evergreen should be using the current science to set a site-specific standard for this site.

In addition, Evergreen should revise its remedial investigation reports to adequately account for the impacts of climate change on existing soil and water contamination. These impacts could occur before, during, and after remediation. Sea-level rise, storm surges, and the increased frequency and volume of events like superstorms could have major implications on the migration of contaminants in the soil and groundwater. In addition, Evergreen completed its remedial investigation reports over three years ago and it is not clear whether the data underlying the reports are still reliable. Evergreen should provide evidence that data from these reports are still representative.

Please take these comments seriously and make the necessary changes.

Sincerely,
Lyndon DeSalvo

Comment

4 general comments:
1. Evergreen and Hilco may have a reasonable and actionable agreement about how the cleanup is divided between you, but the public has no idea whether there is one. It's illogical for Evergreen to be working on a remediation project, and do an incomplete job on an area because some of the contaminants arrived after PES bought it. Or vice-versa-
2. I support the use of mushrooms to extract lead and other heavy metals from the top few feet of soil, as long as the crop is disposed of safely. I'm not an expert but digging up the soil and removing it seems much more work intensive, more expensive, and involves transporting much more volume and weight. It's also not as safe for the community- the contaminated dust blowing into residential areas and then where will all that soil go safely? It seems better to extract it naturally, then compost the vegetation and collect the remaining lesser volume of heavy metal "sludge."

Community Outreach Plan Revised (draft) - August 11 2020

Comment

Benzene wherever it is lurking is a main concern. I have not heard of a way to deal with pools of it underground, or capturing it where it is sitting off the property. It seems to me that Evergreen should work with community members and politicians to activate any other industrial source of benzene nearby to cooperate with you and Hilco in a complete clean-up. Too many people have lost their lives to cancer. Would you consider that?

Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Thursday, January 14, 2021 5:36:23 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Community Outreach Plan Revised (draft) - August 11 2020

Comment

Comments on Legacy Remediation of the Philadelphia Refinery site

Philadelphians have lived through a refinery explosion, and we have awakened to the danger we've been living with for the past 150 years.

We need to acknowledge that the refinery site in Southwest Philadelphia will never be allowed to house a refinery again. Therefore, any remediation done to this land must be done with this in mind.

In reviewing the reports on the Philly Refinery Cleanup site, it appears that the Evergreen reports open for public comment are at least three years old and may not necessarily reflect current site conditions.

Of concern is the high lead levels on this site. We all know lead is bad for our health. My understanding from the CDC is that unsoiled “soil contains lead concentrations less than 50 parts per million (ppm), but soil lead levels in many urban areas exceed 200 ppm.” The same link states that the “EPA's standard for lead in bare soil in play areas is 400 ppm by weight and 1200 ppm for non-play areas”. If I understand correctly, our state had a threshold of 1000 ppm that was increased to 2500 ppm earlier this year. Current lead levels in residential areas near the refinery site have lead levels greater than 3000 ppm; see this screen shot from PennMedicine’s Center of Excellence in Environmental Toxicology’s map of our region.

Since this site will never be a refinery again, we need to remediate the soil on the site so that the lead concentration drops, if not to 50 ppm, then to 400 ppm.

I noticed that there was no reference to climate change nor rising sea levels, yet this is a concern for many residents.

Of the 10 areas of interest discussed on the Philly Refinery Cleanup site, six are low lying plots which will likely be flooded by sea level rise. Look at page 28 of the report by the Lindy Institute at Drexel University and the Clean Air Council. It shows that the Evergreen areas of interest 5, 6, 7, 8, 9 and 10 will be submerged. These especially need to be remediated to green space, to wetlands that can embrace the rising tides, and invite other species to nest and thrive along the shifting banks of the Delaware River.

Conventional land remediation consists of capping the contaminated soil with tarp and/or concrete; or hauling the soil someplace else. Capping ignores the problem for a few decades at most, until chemicals leach out. In this case, into the Delaware River. Hauling the soil elsewhere just pushes the problem of

leaching onto another bioregion. Neither of these methods is true remediation since we're either burning, burying, or relocating the contamination. Eco-remediation is the most cost effective method of remediating soil and water, per figure 98 in "Mycelium Running, Paul Stamets.

We understand that contamination has reached the deep aquifer (area of interest 11), which means we need to clean the water too. We've learned from the Clean Air Council that "while Evergreen has made available semiannual groundwater reports through the first half of 2020, that information is not part of the reports open for public comment".

In summary -- we need to get the lead, arsenic and other heavy metals out of this soil. This is why Evergreen was formed, and what Sunoco's insurance policy was for. Let's use it wisely, for the common good, for an evergreen delta where the Schuylkill River meets the Delaware River.

Date: Thursday, January 14, 2021 3:36:36 PM

Evergreen Resources,

Clean up on the former refinery site is extremely important to me, as a resident of Philadelphia and as someone concerned about what wetter conditions and the higher water table expected with climate change will mean for the future of the site and existing contamination.

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:

- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.
- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Community Outreach Plan Revised (draft) - August 11 2020

Comment

Thank you for the responses at this week's meeting. Here's some references that I mentioned.

A 2014 Report by climate change consultants ICF was commissioned by the City of Philadelphia: 'Useful Climate Information for Philadelphia: Past and Future.'

https://www.phila.gov/media/20160505145605/Useful-Climate-Science-for-Philadelphia.pdf

The report states: "for decisions in Philadelphia for which
there is high aversion to risk, a scenario of 2 meters should be considered."

The 2014 ICF report informed the 2015 City report 'Growing Stronger: Toward a Climate Ready Philadelphia.'

https://www.phila.gov/departments/office-of-sustainability/programs/climate-adaptation-planning/

There is also geological subsidence (not connected with climate change) occurring along the NE Atlantic coast, at a rate very approximately of about 1.5mm(?)/year.

https://oceanservice.noaa.gov/facts/glacial-adjustment.html

I also recently saw a 2019 technical report from Tampa Bay, which has 8.5 feet as its high-end worst case scenario.

At the moment these high-end scenarios are not likely, but this could change.

Attachment 4

(Clean Air Council Comments on
Proposed Act 2 Rulemaking, dated April 30, 2020)

CLEAN AIR COUNCIL

Environmental Quality Board
(Department of Environmental Conservation)

Proposed Rulemaking
Administration of the Land Recycling Program
25 Pa. Code Chapter 250

50 Pa.B. 1011-1097 (February 15, 2020)

Written Comments by Clean Air Council

April 30, 2020

Via email -- RegComments@pa.gov

The Council appreciates the opportunity to provide these written comments on the proposed rulemaking of the Environmental Quality Board and the Department of Environmental Protection ("the Department") relating to Act 2, the state law regarding cleanup standards for voluntary and involuntary cleanups.

The Council is a non-profit environmental health organization headquartered at 135 South 19th Street, Suite 300, Philadelphia, Pennsylvania, 19103. The Council also maintains an office in Pittsburgh. The Council has been working to protect everyone's right to a clean environment for over 50 years. The Council has members throughout the Commonwealth who support its mission.

While the Environmental Quality Board is the government entity proposing the rulemaking, the Council will refer to the Department as the source of the proposed rulemaking, in the interest of clarity.

On Saturday, February 15, 2020 the Department published a notice of proposed rulemaking, setting a deadline of April 14, 2020 for the public comment period. 50 Pa.B. 1011-1097 (February 15, 2020). The deadline was extended to April 30, 2020 due to the ongoing COVID-19 pandemic. 50 Pa.B. 1650 (March 21, 2020).

Summary of Comments

The Council's comments are directed to the Department's proposed increase in the direct contact numeric value for lead in nonresidential soil from 1000 ppm to 2500 ppm. The proposal would not be protective of public health.

The proposal is erroneously based on a target blood concentration of 10 µg/dL for a fetus, which is based on a "level of concern" value set by the Centers for Disease Control in 1991 -- nearly thirty years ago. In 2012, the Centers for Disease Control lowered the number to 5 µg/dL, and since then it has used this number as a "reference value" for case management for pregnant women and children up to 5 years old. The Pennsylvania Department of Public Health, the Allegheny County Health Department, and the City of Philadelphia have also been using 5 µg/dL for case management.

There is no adequate public health justification for the proposal. There was no credible attempt to set an appropriate target blood concentration or direct contact numeric value. Minutes of meetings of the Cleanup Standards Scientific Advisory Board (CSSAB) and related documents do not reflect any meaningful discussion of the choice between a target blood concentration of 10 µg/dL and 5 µg/dL.

The proposal would be far weaker than comparable cleanup levels in five of the six states neighboring Pennsylvania.

The direct contact numeric value for lead in nonresidential soil is important to the ongoing remedial investigation at the Philadelphia oil refinery. This site is two and a half miles from the Council's office, and it is located in the poorest large city in the nation. In December 2019, the Department informed people in the community that the proposed direct contact numeric value would affect the cleanup at this site.

In using a target blood concentration of 10 µg/dL as a basis for the proposal, the Department makes the same error that it made when it approved a site-specific standard of 2240 ppm for the Philadelphia oil refinery in 2015. The proposal would endorse this error and enable property owners at contaminated sites to benefit from even less stringent site-specific standards for lead -- in the neighborhood of 2500 ppm. This would be material to a cleanup of the Philadelphia oil refinery, as it would result in a much smaller number of lead exceedances that would have to be dealt with by way of corrective action. For example, for two Areas of Interest (AOI-5 and AOI-9), this would mean only 10 or 11 exceedances each, rather than 55 exceedances each under a value of 1000 ppm.

In a legal challenge, the proposed direct contact numeric value of 2500 ppm would be unreasonable as a matter of law and "not in accordance with law."

The Department should not finalize the proposal. It should retain the current value of 1000 ppm.

Factual Background

"Any remediation standards adopted by this Commonwealth must provide for the protection of public health and the environment." Act 2, § 102(3).

Under the regulations, the Department must review new scientific information that is used to calculate Medium-Specific Concentrations (MSCs) and propose appropriate changes at least 36 months after the most recently promulgated MSCs:

> ***The Department will review new scientific information that relates to the basis of the MSCs as it becomes available*** and will propose appropriate changes for the consideration of the EQB as necessary, but in no case more than 36 months after the effective date of the most recently promulgated MSCs.

25 Pa. Code §250.11 (page 250-9) (bold italics added for emphasis). *See also* Proposed Rule, 50 Pa.B. 1011 (Section D. Background and Purpose).

In preparing this rulemaking, the Department sought the input of the Cleanup Standards Scientific Advisory Board (CSSAB):

> The Department worked with the Cleanup Standards Scientific Advisory Board (CSSAB) during the development of this proposed rulemaking. The CSSAB, which was established by section 105 of Act 2 (35 P.S.§ 6026.105), consists of persons representing a cross section of experience, including engineering, biology, hydrogeology, statistics, medicine, chemistry, toxicology and other related fields. The purpose of the CSSAB is to assist the Department and the Board in developing Statewide health standards, determining the appropriate statistically and scientifically valid procedures and risk factors to be used, and providing other technical advice as needed to implement Act 2.

Proposed Rule, 50 Pa.B. 1012 (Section D. Background and Purpose).

Currently, the nonresidential direct contact numeric value for lead is calculated based on a method developed by the Society for Environmental Geochemistry and Health (SEGH model). 25 Pa. Code §250.306(e), page 250-29, Chapter 250 regulations (pdf). Based on that model, the current regulations set the nonresidential direct contact numeric value for lead at 1000 ppm. *Id.*, 25 Pa. Code chapter 250, Appendix A, Table 4A, page 250-104.

A. The Department proposes to substitute the Adult Lead Methodology for the SEGH Model.

In the proposed rulemaking, the Department proposes to discontinue use of the SEGH model and instead adopt EPA's Adult Lead Methodology (ALM) for calculating the nonresidential direct contact numeric value for lead in soil. *See* Proposed Rule, 50 Pa.B. 1019 (to be codified at 25 Pa. Code §250.306(e)). As defined by EPA, the "(ALM) estimate[s] the concentration of lead in the blood of children, pregnant women and their developing fetuses who might be exposed to lead-contaminated soils." U.S. Environmental Protection Agency, Lead at Superfund Sites (Attachment 1). Because the ALM involves a formula, the Department has also proposed input variables for that formula. *See id.*, 50 Pa.B. 1097 (Draft Chapter 250 rulemaking Table 7, Attachment 2).

While the Department accepted the Centers for Disease Control and Prevention's baseline blood concentration of 0.6 µg/dL (which has decreased since 2012), it did not accept the reference value of 5 µg/dL (which the Centers for Disease Control and Prevention has used since 2012) as the target blood concentration. The Department's choice results in an increase in the direct contact numeric value for lead from 1000 ppm to 2517 ppm, which rounds to 2500 ppm.

B. The Department proposes using a target blood concentration ($PbB_{fetal,0.95}$) of 10 µg/dL.

In the notice of the proposed rulemaking the Department does not identify the target blood concentration that it used. Rather, it lists "TBD" as the target blood concentration ($PbB_{fetal,0.95}$). *See* 50 Pa.B. 1097 (Draft Chapter 250 rulemaking Table 7, Attachment 2).

In April 2018, minutes from a CSSAB meeting show that the Department was aware of adverse health effects associated with a lead blood concentration of 10 µg/dL, and requested guidance from the CSSAB as to which blood lead level, 5 µg/dL or 10 µg/dL, should be used to calculate the lead direct contact numeric value:

> ***EPA and Centers for Disease Control and Prevention (CDC) have determined that childhood blood lead concentrations at or above 10 micrograms of lead per deciliter (µg/dL) present risks to children's health. However, CDC has a blood lead action level of 5 µg/dL***. Additionally, the input parameters used in calculating the residential ingestion numeric value for lead in soil are based on EPA's Integrated Exposure Uptake Biokinetic (IEUBK) model from 1990. Guidance was requested regarding which level should be used and whether DEP should update the model used for the input parameters. ***Ms. Guiseppi-Elie stated that blood lead action levels are a top priority for EPA and it is possible that the action level could go as low as 3 µg/dL***.

Cleanup Standards Scientific Advisory Board, Meeting Minutes, page 4 (April 4, 2018, Attachment 3) (bold italics added for emphasis).

Although the EPA member offered to research the issue and report back, the minutes from the subsequent meetings do not indicate any further discussion. *See* Department of Environmental Protection, Agendas and Handouts.

In August 2018, the Department made a presentation to the CSSAB at its meeting, noting the adverse health effects associated with a blood lead concentration of 10 µg/dL and that EPA was updating its strategy to address them:

> EPA – ***Recent scientific evidence has demonstrated adverse health effects at blood lead concentrations below 10 µg/dL down to 5 µg/dL, and possibly below***. OSRTI [Office of Superfund Remediation and Technology Innovation] is developing a new soil lead policy to address this new information.

Department of Environmental Protection, PowerPoint Presentation (August 1, 2018, Attachment 4), page 9 (bold italics added for emphasis). The CSSAB made a recommendation to use a target blood concentration of 10 µg/dL:

> ***CSSAB recommended that 10 µg/dL be used*** in the equation to calculate medium-specific concentrations (MSCs) for residential and non-residential lead exposure.

Cleanup Standards Scientific Advisory Board, Meeting Minutes, page 4 (August 1, 2018, Attachment 5) (bold italics added for emphasis). But the minutes do not provide any discussion or justification for this recommendation. *See id.* Among "potential action items," the meeting minutes mention the formation of a workgroup to further discuss lead blood level concentrations. *See id.*, page 5. It is not clear whether such a workgroup was ever formed.

In February 2019, the CSSAB held its next meeting, apparently reviewing a lead model comparison sheet prepared by the Department. *See* Department of Environmental Protection, Lead Model Comparison Sheet (undated, Attachment 6).[1] This sheet compares the current direct contact numeric value (1000 ppm) with two other values calculated using the ALM. With a target blood concentration of 5 µg/dL, the direct contact numeric value would be 1050 ppm. With a target blood concentration of 10 µg/dL, the direct contact numeric value would be 2517 ppm. (Apparently, the Department rounded down the 2517 ppm figure to arrive at the proposed value of 2500 ppm).

But the minutes from the CSSAB meeting provide no discussion of the choice between the two target blood concentrations. *See* Cleanup Standards Scientific Advisory Board, Meeting Minutes (February 13, 2019, Attachment 7).

For the February 2019 meeting, the Department's presentation demonstrates that the choice of a target blood concentration had been made before that meeting:

[1] Although undated, the document was posted among the materials for the February 13, 2019 meeting. *See* Department of Environmental Protection, Agendas and Handouts.

> Residential and non-residential direct contact values [were] calculated for lead using updated models and target blood lead level of 10 µg/dL.

Department of Environmental Protection, PowerPoint Presentation, page 12 (February 13, 2019, Attachment 8). Accordingly, the Department prepared a draft Table 4A for cleanup levels, containing a nonresidential direct contact numeric value of 2517 ppm. *See* Draft Chapter 250 rulemaking Table 4A (February 13, 2019, Attachment 9). However, draft Table 7 did not identify the chosen blood lead concentration, instead listing it as "TBD." *See* Department of Environmental Protection, Draft Chapter 250 rulemaking Table 7 (February 13, 2019, Attachment 2).

For subsequent meetings of the CSSAB on June 12, 2019 and October 29, 2019, the Department posted updated versions of these proposed tables. For the nonresidential direct contact numeric value, the Department rounded down the 2517 ppm number to 2500 ppm. *See* Draft Chapter 250 rulemaking Table 4A (June 12, 2019, Attachment 10), Draft Chapter 250 rulemaking Table 4A (October 29, 2019, Attachment 11).

However, the Department continued to list the target concentration as "TBD," even though it had clearly made a determination to use a target blood lead level of 10 µg/dL. *See* Draft Chapter 250 rulemaking Table 7 (June 12, 2019, Attachment 12), Draft Chapter 250 rulemaking Table 7 (October 29, 2019, Attachment 13). This is also how the Tables appear in the notice of the proposed rulemaking. *See* 50 Pa.B. 1072 (Table 4A), 1097 (Table 7).

Comments

1. **It is the Policy of Public Health Agencies and Medical Organizations to Monitor Pregnant Women With Blood Lead Levels Over 5 ug/dL.**

The Department used the Adult Lead Methodology (ALM) as a basis for proposing the direct contact numeric value for lead. This methodology is designed to be protective of the fetus of a pregnant worker at a contaminated site. U.S. Environmental Protection Agency, Lead at Superfund Sites: Frequent Questions from Risk Assessors on the Adult Lead Methodology ("We assume that cleanup goals (preliminary remediation goals, or PRGs) that are protective of a fetus will also afford protection for male or female adult workers," Attachment 14). Accordingly, it is important to keep in mind the medical literature relating to fetal blood levels. A sample of that literature demonstrates that there is no "safe" maternal lead blood level for fetuses.

Maternal blood lead levels below 10 µg/dL have been linked to adverse birth outcomes (*See*, e.g., The American College of Obstetricians and Gynecologists, Committee Opinion, Lead Screening During Pregnancy and Lactation (August 2012, reaffirmed in 2016, Attachment 15)). The World Health Organization states that "[t]here is no known 'safe' blood lead concentration; even blood lead concentrations as low as 5 µg/dL, may be associated with decreased intelligence in children, behavioral difficulties and learning problems. As lead exposure increases, the range and severity of symptoms and effects also increases." The World Health Organization, Lead Poisoning and Health, (August 23, 2019, Attachment 16).

The Committee on Obstetric Practice of the American College of Obstetricians and Gynecologists identifies pregnant women with blood lead levels higher than 5 µg/dL as requiring "avoidance of further exposure," "specific nutritional recommendations regarding calcium and iron supplementation" (to reduce risk from lead), and may be asked to discontinue breastfeeding their infants if the infant's blood lead level is higher than 5 µg dL. The American College of Obstetricians and Gynecologists, Committee Opinion, Lead Screening During Pregnancy and Lactation (August 2012, reaffirmed in 2016, Attachment 15).

The Centers for Disease Control and Prevention notes that "If a pregnant or lactating woman has blood lead levels (BLLs) ≥5 µg/dL, the health care provider should attempt to determine the source(s) of lead exposure, working with the local health department and occupational medicine specialists as needed for environmental assessment and case management." Centers for Disease Control and Prevention, Breastfeeding (Attachment 17).

The National Capital Poison Center and HealthyChildren.org (associated with the American Academy of Pediatrics) also use a value of 5 µg/dL as a threshold for additional health interventions. *See* The National Capital Poison Center, Lead and Pregnancy ("If the level is 5 or above, repeat testing is needed. How often a woman is re-tested depends on her blood lead level. Pregnant women with lead levels of 5 mcg/dL or above also need extra calcium and iron in their diets. These supplements help prevent higher blood lead levels.", Attachment 18); *see also* HealthyChildren.org, Blood Lead Levels in Pregnant & Breastfeeding Moms ("Although most people will have some lead in their blood, levels greater than 5 micrograms per deciliter (µg/dL) indicate that there is some exposure that needs to be addressed.", Attachment 19).

In using a target blood concentration of 10 µg/dL for lead as a basis for calculating a proposed direct contact numeric value of 2500 ppm, the Department disregards policies set by the Centers for Disease Control and Prevention, the American College of Obstetricians and Gynecologists, and other medical organizations, putting pregnant women and their fetuses at risk.

2. <u>Public Health Agencies Use a Blood Lead Level of 5 µg/dL as a Basis for Managing Lead Exposure in Children 0-6, a Particularly Sensitive Population</u>.

The dangers of children's exposure to lead are well-documented and have been known for centuries. U.S. Department of Health and Human Services, National Toxicology Program, NTP Monograph on Health Effects of Low-Level Lead, page xv (June 2012, Attachment 20). Blood lead concentrations under 10 µg/dL are associated with reduced postnatal growth, decreased hearing, increased hypersensitivity to allergens, increased incidence of essential tremor, increased blood pressure, increased risk of hypertension, increased incidence of ALS, and increased cardiovascular-related mortality. *Id.*, Executive Summary, page xix, Table 1.1. The NTP Report "concludes that there is *sufficient* evidence for adverse health effects in children and adults at blood [lead] levels" less than 10 µg/dL and less than 5 µg/dL. *Id.*, Executive Summary, page xviii.

Federal and state public health agencies have applied a reference level of 5 ug/dL to guide their case management for children exposed to lead, starting at birth. Of course, any target blood concentration for a fetus should be as stringent or more stringent than an "elevated blood lead level" set by a public health agency for the protection of children.

A. The Centers for Disease Control and Prevention uses a reference level of 5 µg/dL for case management for children exposed to lead.

As part of the U.S. Department of Health and Human Services, the Centers for Disease Control and Prevention implements a lead poisoning prevention program. Centers for Disease Control and Prevention, Lead Poisoning Prevention (Attachment 21). Over time, the Centers for Disease Control and Prevention have lowered the concentration of lead in blood that is considered "elevated" in children, from 30 µg/dL to 25 µg/dL (in 1985), to 10 µg/dL (in 1991), and to 5 µg/dL (in 2012). *See* National Toxicology Program, NTP Monograph on Health Effects of Low-Level Lead, page xv (Attachment 20); *see also* Centers for Disease Control and Prevention, Blood Lead Levels in Children (Attachment 22).

In 2012, an advisory committee recommended that the Centers for Disease Control and Prevention eliminate the use of the phrase "level of concern" and lower the number from 10 µg/dL to 5 µg/dL:

> KEY POINTS/RECOMMENDATIONS
>
> Based on the scientific evidence, ***the ACCLPP recommends that the term "level of concern" be eliminated from all future agency***

> ***policies, guidance documents, and other CDC publications***, and that current recommendations based on the "level of concern" be updated according to the recommendations contained in this report.
>
> ***CDC should use a childhood BLL reference value based on the 97.5th percentile of the population BLL in children ages 1-5 (currently 5 µg/dL) to identify children and environments associated with lead-exposure hazards***. The reference value should be updated by CDC every four years based on the most recent population based blood lead surveys among children.

Advisory Committee on Childhood Lead Poisoning Prevention of the Centers for Disease Control and Prevention, Low Level Lead Exposure Harms Children: A Renewed Call for Primary Prevention, page 3 (January 4, 2012, Attachment 23) (bold italics added for emphasis).

The Centers for Disease Control and Prevention concurred with this recommendation, discontinuing the use of the phrase "level of concern" and adopting the term "reference value." Centers for Disease Control and Prevention, CDC Response to Advisory Committee on Childhood Lead Poisoning Prevention Recommendations in "Low Level Lead Exposure Harms Children: A Renewed Call of Primary Prevention", page 5, Recommendation I (June 7, 2012, Attachment 24). In addition, it lowered the number from 10 µg/dL to 5 µg/dL, committing to use the lower number for case management and distribution of public health information:

> In FY12, CDC will:
>
> a. ***Use the reference value*** in recommendations that ***involve follow-up evaluation of children*** after BLL testing.
>
> b. ***Use the reference value*** as defined to ***identify high-risk childhood populations*** and geographic areas most in need of primary prevention.
>
> c. ***Provide this information***, including specific high-risk areas, ***to a wide variety of federal, state, and local government agencies*** and nongovernment organizations interested in lead-poisoning prevention.

Id., pages 6-7, Recommendation II.

To illustrate, the website of the Centers for Disease Control and Prevention sets forth a matrix tailoring case management activities to particular blood lead levels (less than 5 µg/dL, 5–9 µg/dL, 10–19 µg/dL, etc.). Centers for Disease Control and Prevention, Recommended Actions Based on Blood Lead Level (Attachment 25). At blood lead levels of 5-9 µg/dL, "case management" includes follow-up testing, an investigation of potential sources of lead exposure, and nutritional counseling. *See id.*

B. The Department of Housing and Urban Development uses a blood lead level of 5 µg/dL for case management for children exposed to lead.

The Department of Housing and Urban Development has adopted the 5 µg/dL reference value of the Department of Health and Human Services (Centers for Disease Control and Prevention) in its regulatory approach to exposure to lead-based paint in public housing. In 2016 and 2017, it proposed and finalized a rule that defined an "[e]levated blood lead level" as "a confirmed concentration of lead in whole blood of a child under age 6 equal to or greater than the concentration in the most recent guidance published by the U.S. Department of Health and Human Services (HHS) on recommending that an environmental intervention be conducted…."). Proposed Rule, 81 Fed. Reg. 60,304, 60,324 col. 1 (September 1, 2016), Final Rule, 82 Fed. Reg. 4151, 4167 (January 13, 2017) (to be codified at 40 C.F.R. 35.110 (Definitions)).

At the time of the rulemaking, the Centers for Disease Control and Prevention had already adopted the reference value of 5 µg/dL. *See* Proposed Rule, 81 Fed. Reg. 60,306 col. 2 ("CDC's current reference range level is 5 mg/dL (5 micrograms of lead per deciliter).").

For the Department of Housing and Urban Development, an "elevated blood lead level" is the threshold for lead in blood in a child that triggers a number of regulatory requirements for investigation. *See id.*, 82 Fed. Reg. 4167-4172 (to be codified at 40 C.F.R. §§35.325(a), 35.730(a), 35.830(a), 35.1130(a), 35.1225(a)).

C. The Pennsylvania Department of Health defines a blood lead level of 5 µg/dL as "elevated," requiring monitoring and case management for children.

The Pennsylvania Department of Health follows the Centers for Disease Control and Prevention's reference value of 5 µg/dL as an "elevated lead blood level" for children:

> Exposure to lead, even at low levels, can cause intellectual, behavioral and academic deficits. [footnotes omitted]. For this reason, ***in 2012, the Centers for Disease Control and Prevention (CDC) defined an elevated blood lead level (EBLL) as a blood lead level (BLL) ≥ 5 micrograms per deciliter (µg/dL).*** [footnote omitted]. ***This value is also used to identify children who require case management*** because, even at low levels, lead has been known to affect IQ, the ability to pay attention and educational achievement.

See Pennsylvania Department of Public Health, Childhood Lead Poisoning Prevention Program, 2018 Childhood Lead Surveillance Annual Report (January 2020, Attachment 26), page 3 (Executive Summary) (bold italics added for emphasis). The Department of Health applies this level for its own purposes by defining an elevated blood level as a level equal to or greater than 5 µg/dL. *See id.*, page 12 (Definitions) ("Elevated blood lead level (EBLL): A BLL ≥ 5 µg/dL"). The Department of Health also uses the terms "confirmed EBLL ≥ 5 µg/dL" and "confirmed EBLL ≥ 5 µg/dL," but only to differentiate among effects of different ranges, both of which are considered "elevated." *See id.* Those ranges become important in differentiating impacts and

responses. *See id.*, pages 17-47, Tables 1-14). To illustrate, in 2018, among children aged 0-71 months, 2.99% had elevated levels between 5 and 9.9 µg/dL, and 1.10% had elevated levels equal to or greater than 10 µg/dL. *Id.*, page 16 (Table 3).

The Department of Health then uses the 5 µg/dL level for monitoring children throughout the state in areas not subject to the jurisdiction of the county and municipal health departments:

> ***The Department's community health nurses (CHNs) continue to monitor elevated lead levels (≥ 5 µg/dL) in children aged 6 and under living in Pennsylvania***. The Department's community health nurses cover the counties and areas of the state not covered by the 10 county and municipal health departments (CMHDs). ***The CMHDs include six county (Allegheny, Bucks, Chester, Erie, Montgomery, and Philadelphia) and four municipal (Allentown, Bethlehem, Wilkes-Barre, and York city) health departments and have their own specific case management protocols***.

Id., page 5 (bold italics added for emphasis).

D. The Allegheny County Health Department uses a blood lead level of 5 µg/dL for case management for children exposed to lead.

The Allegheny County Health Department has jurisdiction over the metropolitan area of Pittsburgh and neighboring communities in Allegheny County. Its universal lead testing regulation went into effect on January 1, 2018. *See* Article XXIII, Universal Blood Lead Level Testing Regulations, Section 10 (effective July 5, 2017, Attachment 27). It requires all children to be tested for lead exposure at approximately 9-12 months old and then again at approximately 24 months old. *See* Allegheny County Health Department, Blood Lead Level Testing (Attachment 28).

If the blood level is below 5 µg/dL, a follow-up test is not needed:

> **If the result is below 5 µg/dL:**
>
> - Your child's blood level is not elevated at this time. It is below the CDC's reference value, which is 5 µg/dL.
> - Your child does not need a follow-up test now.
> - If your child is younger than 2 years old, s/he will need another test when s/he is approximately 24 months old.
> - Your child may need another test if s/he moves to a different home, daycare, school, etc. that was built before 1978.
> - Go to our Prevention page to see how to keep your child safe from lead exposure.

Id. ("What Do the Test Results Mean?"). If the blood level is above 5 µg/dL, the Health Department considers the blood level to be elevated, requiring a confirmatory test:

If the result is at or above 5 µg/dL:

- Your child's blood level is elevated.
- If the test was a capillary test (in which blood is drawn from a finger stick) it needs to be confirmed with a venous test, in which blood is drawn from the arm. Capillary samples are easier to contaminate and sometimes the result is not accurate.
- Confirmatory tests need to be prescribed by your child's doctor. If your child is under- or uninsured, please see ACHD's Guide for Under and Uninsured Residents for a list of pediatric healthcare resources in Allegheny County that can help.
- Check the table below to see when your child should get a confirmatory test:

Recommended Schedule for Obtaining a Confirmatory Venous Sample

BLL (µg/dL)	Time to confirmation testing
<5	No confirmation required
5-9	1 week - 1 month[a]
10-44	1 week - 1 month[a]
45-59	48 hours
60-69	24 hours
≥70	Urgently as emergency test

[a] The higher the BLL on the screening test, the more urgent the need for confirmatory testing.

If the venous test confirms result at or above 5ug/dl, get more information on next steps by visiting My Child Has an Elevated Blood Lead Level.

Id. Like the Centers for Disease Control and Prevention and the Pennsylvania Department of Health, the Allegheny County Health Department draws an important line at 5 µg/dL.

E. The Philadelphia Department of Public Health uses a blood lead level of 5 µg/dL for case management for children exposed to lead.

Like the state health department, the Philadelphia Department of Public Health defines an elevated blood level as a level equal to or greater than 5 µg/dL. *See* Philadelphia Department of Public Health, Childhood Lead Poisoning Surveillance Report (2017, Attachment 29), page 3 (Definitions) ("Elevated BLLs (EBLLs) in this report are classified as either 5-9 µg/dL or ≥10 µg/dL"). Like the state health department, it creates different categories of elevated blood levels (5-9 µg/dL and ≥10 µg/dL) for the purpose of gathering information and tailoring case management. To illustrate, in 2017, among children aged 0-71 months, 4.6% of newly identified blood lead levels were between 5 and 9 µg/dL, and 1.1% were equal to or greater than 10 µg/dL. *Id.*, page 10 (Table 4).

In using a target blood concentration of 10 µg/dL for lead as a basis for calculating a proposed direct contact numeric value of 2500 ppm, the Department disregards policies set by the Centers for Disease Control and Prevention, the Department of Housing and Urban Development, the Pennsylvania Department of Public Health, the Allegheny County Health Department, and the City of Philadelphia for children 0-6, and by extension the fetuses that are the target population of the ALM.

3. **The Proposed Direct Contact Numeric Value Would Have a Significant Negative Impact on Cleanups Throughout the Commonwealth.**

The Commonwealth of Pennsylvania recognizes the risks of exposure to lead and the prevalence of lead throughout the state. Joint State Government Commission, Advisory Committee and Task Force on Lead Exposure, Lead Exposure Risks and Responses in Pennsylvania (April 2019, Attachment 30). The conclusions of this state report are consistent with the conclusions about the detrimental health effects of lead outlined above. *See id.*, page 5 ("Children are at the greatest risk of lead poisoning, which can cause neurological damage, organ damage and death, but adults and the elderly can also suffer health concerns from lead exposure."), page 46 ("Intensive medical studies have found that young children are particularly vulnerable to the toxic effects of lead and can suffer profound and permanent adverse health effects, most notably affecting the development of a child's brain and nervous system.").

The state report noted that lead is a special concern in this Commonwealth due to "the age of Pennsylvania's infrastructure and history as an industrial center." *Id.*, page 5. The prevalence of elevated blood lead levels above 10 µg/dL in adults in Pennsylvania is among the highest in the nation:

> Of the 28 states reporting blood lead levels of greater than or equal to 10 µg/dL to the CDC under its Adult Blood Lead Epidemiology and Surveillance (ABLES) programs in 2013, ***Pennsylvania had the third highest prevalence rate at 49.1 per 100,000 employed adults aged 16 or older***. This is more than twice the average of 20.4. ***Pennsylvania had the highest prevalence rate for blood lead levels greater than or equal to 25 µg/dL at 25.7***. The average rate at this blood lead level was 5.2.

Id., page 46 (bold italics added for emphasis). But 10 µg/dL is not the goal. In the next sentence, the report notes that "[r]ecent studies have "found decreased renal function associated with BLLs at <5 µg/dL and increased risk of hypertension and essential tremor at BLLs <10 µg/dL." *Id.* (citing authority).

The proposed direct contact numeric value is not protective of human health because it is calculated using a target blood concentration for lead that is associated with significant negative health effects. Additionally, using this outdated target blood concentration enables remediators to develop site-specific standards that are not protective of public health. This is important because the flawed methodology would affect a broad range of sites.

A. The direct contact numeric value is not protective of human health.

In the notice of the proposed rulemaking, the Department erroneously asserts that the proposed direct contact numeric value for lead would protect public health:

> ***These proposed changes, based on new information, would protect public health and the environment*** and would provide the regulated community with clear information regarding the requirements of Act 2 and Chapter 250 related to the remediation of contaminated sites.

50 Pa.B. 1011, col. 1 (February 15, 2020) (bold italics added for emphasis). This statement is erroneous because the Department includes "new scientific information" that is favorable to a higher value (the baseline blood concentration), but does not include updated scientific information that is favorable to a lower value (the target blood concentration). *See* 25 Pa. Code §250.11 (requiring the Department to review "new scientific information" and propose "appropriate changes").

Numerically, the proposed direct contact numeric value is located in a table. 50 Pa.B. 1072 (proposing a direct contact numeric value of 2500 ppm, and deleting existing direct contact numeric value of 1000 ppm). The methodology for calculating the proposed standard is set forth in a subsection relating to ingestion numeric values. *See* 50 Pa.B. 1019-1020 (proposed regulatory text). The Department proposes to discontinue use of the existing model of the Society for Environmental Geochemistry (SEGH) and instead use the Adult Lead Methodology of EPA:

> (e) The residential ingestion numeric value for lead in soil was developed using the **[Uptake Biokinetic (UBK) Model for Lead (version 0.4)]** **Integrated Exposure Uptake Biokinetic (IEUBK) Model for Lead in Children, Windows®® version (IEUBKwin v1.1 build 11) 32-bit version** developed by the EPA (U.S. Environmental Protection Agency. (**[1990]** **February 2010**) **[Uptake Biokinetic (UBK) Model for Lead (version 0.4). U.S. EPA/ECAO. August 1990,]** in lieu of the algorithms presented in subsections (a) and (b). Default input values are identified in Appendix A, Table 7. Because the **[UBK]** **IEUBK** model is applicable only to children, the nonresidential ingestion numeric value was calculated **[according to the method developed by the Society for Environmental Geochemistry and Health (Wixson, B. G. (1991)). The Society for Environmental Geochemistry and Health (SEGH) Task Force Approach to the Assessment of Lead in Soil. *Trace Substances in Environmental Health*. (11-20), using the following equations:**

$$S = \frac{1000\left[\left(\frac{T}{G^n}\right) - B\right]}{\delta}$$

]

using EPA's Adult Lead Methodology (ALM) in accordance with the guidance, exposure factors, equations, and spreadsheets provided in EPA's *Recommendations of the Technical Review Workgroup for Lead for an Approach to Assessing Risks Associated with Adult Exposures to Lead in Soil* (EPA-540-R-03-001, OSWER Dir # 9285.7-54, January 2003), *OLEM Directive 9285.6-56 "Update to the Adult Lead Methodology's Default Baseline Blood Lead Concentration and Geometric Standard Deviation Parameters"* (May 2017) and the associated June 14, 2017, version of the *Calculations of Preliminary Remediation Goals (PRGs) for Soil in Nonresidential Areas U.S. EPA Technical Review Workgroup for Lead, Adult Lead Committee* spreadsheets. Table 7 identifies each of the variables **[in this equation] used to calculate the nonresidential ingestion numeric value for lead**.

Id. (proposed §250.306(e)) (emphasis in original; bold underlining in original represents new material; brackets in original represents deleted material).

The proposed rule states that the direct contact numeric value was calculated using the ALM and in accordance with the guidance, and spreadsheets, contained in three documents.

The first document is an EPA guidance document regarding the use of the ALM, published in 2003. U.S. EPA, Technical Review Workgroup for Lead, Recommendations of the Technical Review Workgroup for Lead for an Approach to Assessing Risks Associated with Adult Exposures to Lead in Soil (EPA-540-R-03-001, January 2003, Attachment 31). At that time, EPA was recommending a target blood lead concentration of 10 µg/dL. *See id.*, page 6, Table 1. EPA published this document before the Centers for Disease Control lowered its threshold from 10 µg/dL to 5 µg/dL in 2012.

The second document is an update published by EPA in 2017 that addressed newer scientific information regarding blood levels. That document set forth a table of calculations for Preliminary Remediation Goals (essentially, cleanup levels), based on a "5% probability that a fetus' blood lead level will not exceed a 5 µg/dL blood lead target level":

Table 3. Current and previous PbB_0 and GSD_i parameter values shown in the ALM *PRG calculation* tab of the ALM spreadsheet. Calculations of PRGs 5% probability that a fetus' blood lead level will not exceed a 5 µg/dL blood lead target level.

Variable	Description of Variable	Units	Current GSDi and PbB_0 from Analysis of NHANES: 2009-2014	Previous GSDi and PbB_0 from Analysis of NHANES 1999-2004
$PbB_{fetal, 0.95}$	95th percentile PbB in fetus	µg/dL	5	5
$R_{fetal/maternal}$	Fetal/maternal PbB ratio	--	0.9	0.9
BKSF	Biokinetic Slope Factor	µg/dL per µg/day	0.4	0.4
GSD_i	Geometric standard deviation PbB	--	1.8	1.8
PbB_0	Baseline PbB	µg/dL	0.6	1.0
IR_S	Soil ingestion rate (including soil-derived indoor dust)	g/day	0.050	0.050
$AF_{S, D}$	Absorption fraction (same for soil and dust)	--	0.12	0.12
$EF_{S, D}$	Exposure frequency (same for soil and dust)	days/yr	219	219
$AT_{S, D}$	Averaging time (same for soil and dust)	days/yr	365	365
PRG	**Preliminary Remediation Goal Soil Lead Concentration where PbB_i = 5 µg/dL**	**ppm**	**1050**	**773**

U.S. EPA, OLEM Directive 9285.6-56, Update of the Adult Lead Methodology's Default Baseline Blood Lead Concentration and Geometric Standard Deviation Parameters and the Integrated Exposure Uptake Biokinetic Model's Default Maternal Blood Lead Concentration at Birth Variable, page 6, Table 3 (May 2017, Attachment 32).

Attached to the two-page transmittal memorandum was a set of Frequently Asked Questions that stated that EPA was updating its soil lead strategy to incorporate new scientific information recognizing adverse health effects at blood lead concentrations below 10 µg/dL, and that the release date was pending:

> OLEM [Office of Land and Emergency Management] recognizes adverse health effects at blood lead concentrations below 10 µg/dL. ***Accordingly, OLEM is updating the soil lead strategy to incorporate this new information***. However, the release date for the updated strategy is pending.

Id., Transmittal Memorandum, page 3 (bold italics added for emphasis). In the meantime, the TRW Lead Committee recommended the following considerations for all non-residential risk assessments where lead is a contaminant of concern:

> 1. ***The updated NHANES values are appropriate for lead risk assessments for residential and non-residential exposures*** both in

> assessing risk and in developing preliminary remediation goals (PRGs) for your site.
>
> 2. ***Lead risk assessments should include a discussion of*** the most current toxicity information and ***Centers for Disease Control and Prevention Reference level***.
>
> 3. Consistent with risk management best practices, ***caution should be applied when implementing cleanup levels based on the updated NHANES values for non-residential scenarios (PRGs are greater than 2000 ppm using default values).*** Ineffective controls or incorrect land use assumptions could have potentially greater health consequences on children who are exposed (e.g., by visiting, trespassing, or tracking the material to the residence) to these high concentrations (especially given the new toxicity information).
>
> Users are encouraged to contact the technical support hotline, TRW Lead Committee, or regional risk assessor with any questions.

Id. (bold italics added for emphasis).

The third document represents an Excel spreadsheet prepared in 2017 by EPA for calculating Preliminary Remediation Goals for nonresidential soils based on the new scientific information, including the updated target blood concentration. U.S. EPA Technical Review Workgroup for Lead, Spreadsheet for Calculation of PRGs: Appendix B of ALM document(2 pp, 18 K) (June 14, 2017, Attachment 33).[2] In this document there are two sheets: (1) one sheet for Calculations of Blood Lead Concentrations (PbBs) and Risk in Nonresidential Areas and (2) one sheet for Calculations of Preliminary Remediation Goals (PRGs) for Soil in Nonresidential Areas. *See id.* Rather than using 10 µg/dL, EPA used 5 µg/dL as the target blood concentration in both sheets. *See id.* Together with other inputs, this leads to a Preliminary Remediation Goal of 1050 ppm. *See id.*

The use of the 5 µg/dL target blood concentration in this spreadsheet is significant because this spreadsheet was based on a template attached to the 2003 guidance document, which had used 10 µg/dL as the target blood concentration. See Recommendations of the Technical Review Workgroup for Lead for an Approach to Assessing Risks Associated with Adult Exposures to Lead in Soil (January 2003, Attachment 31), Appendix B ("Calculations of Preliminary Remediation Goals (PRGs)," page B-1.

The Department was aware that EPA recognized adverse health effects below 10 µg/dL, and even quoted cautionary language from EPA in its lead model comparison sheet:

[2] The link is on EPA's website: Lead at Superfund Sites: Software and Users' Manuals.

> EPA's lead guidance website states, ***'Recent scientific evidence has demonstrated adverse health effects at blood lead concentrations below 10 µg/dL down to 5 µg/dL, and possibly below***. OSRTI is developing a new soil lead policy to address this new information.
> ….
>
> ***EPA's guidance for the ALM cautions that the values calculated using this new model are high and may not be protective of all receptors, i.e. a school or playground that borders a non-residential property***. This is not necessarily in-line with the purpose of the statewide health standard which should be protective across the entire state.

See Department of Environmental Protection, Lead Model Comparison Sheet (undated, Attachment 6) (bold italics added for emphasis). Still, the Department used 10 µg/dL, rather than 5 µg/dL.

In fact, in the notice of the proposed rulemaking the Department suggests that new scientific information regarding lead exposure leads to the conclusion that the direct contact numeric value should be *weakened*, rather than strengthened:

> The soil numeric values represent a proposed decrease for approximately 83% of the values and an increase for 17% of the values. For groundwater, the proposed changes reflect a decrease for approximately 92% of the values and an increase in approximately 8% of the values. Lowering the values may indicate a more stringent cleanup is required at a site ***and increasing the values may indicate a less stringent cleanup is required at a site***. ***These proposed changes reflect updated information related to exposure limitations to these substances and recognize that a higher or lower standard is better representative of those substances' exposure thresholds***.

See 50 Pa.B. 1012 col. 1 (bold italics added for emphasis). But the Department is going in the *opposite* direction of the science. In the context of a lack of a safe level of exposure to lead, the public health agencies have been focusing on lower blood lead levels, not higher levels. *See* discussion in Comment #2, above.

In the calculation of the direct contact nonresidential soil standard of 2500 ppm, the Department used all the default parameters provided in the 2017 Adult Lead Methodology (Attachment 33), *except* for the target blood level (Department of Environmental Protection, Draft Chapter 250 rulemaking Table 7, February 13, 2019, Attachment 2). In response to an inquiry regarding the development of the proposed direct contact numeric value, the Department stated that "DEP is using EPA's lead methodologies, generally with EPA's default values." *See* Attachment 34 -- Email from C. David Brown to Peter Winslow, dated January 3, 2020.

By asserting that it "generally" used EPA's default values, the Department demonstrated that it was ignoring a value that it considered to be a default value in EPA's 2017 spreadsheet.

In 2020, the Department may not cherry-pick new scientific information -- at least not reasonably. It cannot apply new scientific information that tends to make a standard less stringent (the baseline blood concentration) while ignoring other new scientific information that tends to make a standard more stringent (the target blood concentration). In proposing the direct contact numeric value, the Department adopted the 10 μg/dL target blood concentration in EPA's 2003 guidance document, ignoring the 5 μg/dL target blood concentration in EPA's 2017 guidance document, and ignoring the 5 μg/dL target blood concentration in EPA's 2017 spreadsheet.

Because the target blood concentration used by the Department is not protective of public health, the proposed direct contact numeric value is not protective of public health.

B. The proposed direct contact numeric value would make site-specific standards for lead not protective of public health.

In addition to causing a dramatic increase in the proposed direct contact numeric value, the Department's use of the 10 μg/dL target blood concentration would enable owners of contaminated sites to develop site-specific standards that are not protective of public health.

It does this in two ways. First, it increases the threshold at which a property owner will have an incentive to request a site-specific standard, where the direct contact numeric value prevails over the soil-to-groundwater numeric value. Under the regulations, sometimes the medium-specific concentration is set by the direct contact numeric value, and other times it is set by the soil-to-groundwater numeric value. *See* 25 Pa. Code §250.305(d)(1)-(2). Second, its use of the 10 μg/dL target blood concentration validates the development of a site-specific standard near 2500 ppm, superseding both the direct contact numeric value and the soil-to-groundwater numeric value.

The Department recognizes that the proposed amendments do not change the statutory right of a remediator to develop a site-specific standard for lead:

> ***The proposed amendments to Statewide health standard MSCs would not affect the cleanup options available to remediators under other cleanup standards***. Persons conducting remediation under Act 2 may choose from three different cleanup standards: background, Statewide health ***or site-specific***.

See 50 Pa.B. 1015 col. 1 (bold italics added for emphasis).

Under the statute, a property owner has the option of developing a site-specific standard rather than applying a statewide health standard:

> Section 301. Remediation standards.
>
> (a) Standards.--***Any person*** who proposes or is required to respond to the release of a regulated substance at a site and ***who wants to be eligible for the cleanup liability protection under Chapter 5 shall select and attain compliance with one or more of the following environmental standards when conducting remediation activities***:
>
> (1) a background standard which achieves background as further specified in section 302;
>
> (2) ***a Statewide health standard adopted by the Environmental Quality Board*** which achieves a uniform Statewide health-based level so that any substantial present or probable future risk to human health and the environment is eliminated as specified in section 303; or
>
> (3) ***a site-specific standard which achieves remediation levels based on a site-specific risk assessment*** so that any substantial present or probable future risk to human health and the environment is eliminated or reduced to protective levels based upon the present or currently planned future use of the property comprising the site as specified in section 304.

See Act 2 of 1995, §301(a) (bold italics added for emphasis). The regulations also contemplate the use of a risk assessment for developing a site-specific standard. *See* 25 Pa. Code §250.402 ("The development of site-specific standards shall be based on a site-specific risk assessment, if required.").

For lead in soil, this would mean that a site-specific standard would "almost always" be based on EPA's Adult Lead Methodology:

> I'm assuming the ALM was used to calculate the non-residential site-specific lead standard at the Philadelphia Refinery which resulted in a value of 2,240 mg/kg. ***When we calculated the non-residential direct contact value for the proposed rulemaking using the ALM default exposure factors we ended up with a very similar number of 2,500 mg/kg***. Thus, it is probably safe to say that the differences in the default exposure factors from the SEGH model and the ALM resulted in the difference between the current non-residential direct contact lead value and the site-specific value calculated for the Philadelphia Refinery.
>
> Keep in mind that the non-residential direct contact numeric value will never be the MSC because it is higher than the generic soil to groundwater numeric value of 450 mg/kg. So in cases where the

> SHS is being used, the soil MSC for lead will always be 450 mg/kg. ***For site-specific analyses, such as the Philadelphia Refinery, the ALM is almost always used which results in a value closer to our proposed direct contact non-residential soil lead value***.

Attachment 35, Email from Michael Maddigan, Environmental Group Manager (Land Recycling Program) to C. David Brown, Professional Geologist Manager (Southeast Regional Office), dated December 20, 2019 (bold italics added for emphasis).

In fact, the consultant used the ALM when it developed a site-specific standard of 2240 ppm for its remedial investigation at the Philadelphia oil refinery in 2015, based on a target blood concentration of 10 µg/dL. *See* Evergreen Resources Group, LLC, Human Health Risk Assessment, Section 8.0 (Risk Characterization), pages 9-11 (February 24, 2015, Attachment 36).

The Department approved the site-specific 2240 ppm standard several months later. *See* Memo from C. David Brown to Stephan Sinding, Regional Manager (Environmental Cleanup and Brownfields) (April 30, 2015, Attachment 37) (recommending approval of 2240 ppm standard), Approval Letter from C. David Brown to Evergreen Resources Management Operations (May 6, 2015, Attachment 38).

The Department not only approved the site-specific standard of 2240 ppm for the Philadelphia oil refinery, but also endorsed the use of 10 µg/dL; *See* Memo from C. David Brown to Stephan Sinding, Regional Manager (Environmental Cleanup and Brownfields), page 2 ("The target blood lead concentration is 10 µg/dL, which is considered to be a level in a pregnant worker above which fetal neurological damage could occur," Attachment 37).

The site-specific standard of 2240 ppm for the Philadelphia oil refinery and the Department's proposed nonresidential soil direct contact standard of 2500 ppm were both calculated using the same model (ALM) and the same target blood concentration (10 µg/dL). The minor difference in the two resulting values is due to the Department's use of EPA's updated values for the other model parameters. *See* Spreadsheet for Calculation of PRGs: Appendix B of ALM document (2 pp, 18 K), June 14, 2017, Attachment 33).

C. The proposed direct contact numeric value would not be protective of public health at a broad range of nonresidential properties.

The Department's proposed increase in the direct contact numeric value from 1000 ppm to 2500 ppm would apply to nonresidential sites undergoing cleanups throughout Pennsylvania. The term "nonresidential" is broadly defined to include all industrial and commercial uses of land, as well as related administrative activities:

> ***Any real property on which commercial, industrial, manufacturing or any other activity is done to further either the development, manufacturing or distribution of goods and***

> ***services, intermediate and final products***, including, but not limited to, ***administration of business activities***, research and development, warehousing, shipping, transport, remanufacturing, stockpiling of raw materials, storage, repair and maintenance of commercial machinery and equipment, and solid waste management. This term shall not include schools, nursing homes or other residential-style facilities or recreational areas.

See Act 2 of 1995, §103 (bold italics added for emphasis). Nonresidential means not only oil refineries, but also office buildings and commercial properties. It means properties in both urban and rural areas. Because the proposed direct contact numeric value is not protective of public health, people working on nonresidential properties could be exposed to harmful levels of lead.

The Department proposes a direct contact numeric value that is not protective of human health and enables remediators developing their own site-specific standards to do the same. This is especially inappropriate given the wide range of nonresidential properties to which such standards would apply.

D. The proposed direct contact numeric value would be much greater than comparable cleanup levels in most of the states neighboring Pennsylvania.

With one exception, the states neighboring Pennsylvania have comparable cleanup levels for lead in nonresidential soil that are much lower than the proposed direct contact numeric value of 2500 ppm. The Department should follow the states that recognize harm at lower levels, and maintain the existing direct contact numeric value of 1000 ppm.

Maryland applies a cleanup level of 800 ppm for nonresidential soil in its guidance document. Maryland Department of the Environment, Cleanup Standards for Soil and Groundwater, Interim Final Guidance (Update No. 3) (October 2018, Attachment 39), page 24, Table 1 (setting forth non-residential clean-up standard of 800 mg/kg for soil).

Delaware applies a cleanup level of 1000 ppm in its guidance document. *See* Delaware Department of Natural Resources and Environmental Control, Remediation Standards Guidance Under the Delaware Hazardous Substance Cleanup Act (Revised December 1999, Attachment 40), page 12 (defining "restricted use setting" to essentially mean nonresidential use), Attachment 3, page 8 (1000 mg/kg for restricted use). *See also* Delaware Department of Natural Resources and Environmental Control, Guidance for Human Health Risk Assessments (HHRA) under the Hazardous Substance Cleanup Act (HSCA) (October 2017, Attachment 41), page 19 ("Remediation for lead will normally be required if the EPC [Exposure Point Concentration] is greater than 400 mg/kg (or 800 mg/kg for restricted use sites").

New Jersey applies a cleanup level of 800 ppm in its regulations for nonresidential soil. *See* N.J.A.C. 7:26D (Remediation Standards) (last amended September 18, 2017, Attachment 42), Appendix 1, page 19, Table 1B (setting forth non-residential direct contact soil remediation standard of 800 mg/kg).

Ohio applies a cleanup level of 800 ppm in its regulations. *See* Ohio Environmental Protection Agency, VAP Rules Effective October 17, 2019, OAC 3745-300-08 Appendix A, page 42, Table III (Attachment 43) (setting forth direct-contact soil standard of 800 mg/kg for commercial and industrial land use).

West Virginia applies a cleanup level of 1000 ppm in its legislative rule. West Virginia Department of Environmental Protection, Technical Guidance and Templates, Voluntary Remediation and Redevelopment Rule (W. Va. Legislative Rule 60CSR3) (effective April 1, 2018, Attachment 44), page 3, §60-3-2.24 (defining "industrial land use" to include "land used for commercial establishments"), page 80, Table 60-3B (setting forth risk-based concentration of 1000 mg/kg for industrial soil).

Unlike other neighboring states that set a single standard for nonresidential sites (applying to both commercial and industrial use), New York has set different standards for commercial and for industrial use. For commercial use, New York has set a soil cleanup objective of 1000 ppm, which is the current direct contact numeric value in Pennsylvania (6 CRR-NY 375-6.8(b): Restricted Use Soil Cleanup Objectives, Attachment 45).

For industrial use, New York has set a soil cleanup objective of 3900 ppm (*See* 6 CRR-NY 375-6.8(b): Restricted Use Soil Cleanup Objectives, Attachment 45). New York set this soil cleanup objective in 2006 -- six years before the Centers for Disease Control and Prevention embraced a reference value of 5 µg/dL. *See* 6 NYCRR PART 375 (Effective December 14, 2006, Attachment 45). Moreover, the Technical Support Document in that rulemaking notes that it was following the Centers for Disease Control and Prevention's "level of concern" from 1991:

> ***The blood lead level is typically 10 mcg/dL*** (micrograms of lead per deciliter of blood), ***which is the Centers for Disease Control and Prevention (CDC) level of concern for blood lead in young children*** (ATSDR, 1999; ***CDC, 1991***). In most cases, the guidelines are derived so that the blood levels of almost all children exposed at the guideline would be below 10 mcg/dL. ***This is the approach taken in the derivation of the SCOs for lead*** (see Section 5.3.4 Chronic Lead SCOs).

See New York State Department of Environmental Conservation and New York State Department of Health, Technical Support Document (September 2006, page 40, Attachment 46). The fact that New York has not amended its soil cleanup objective for industrial use to catch up with the science is not a justification for Pennsylvania to do the same for all nonresidential uses -- including both commercial and industrial uses.

4. <u>The Soil-to-Groundwater Numeric Value Does Not Render the Proposed Direct Contact Numeric Value Meaningless.</u>

The Department has asserted that the proposed direct contact numeric value for lead has no legal effect because it will always be superseded by a more stringent soil-to-groundwater numeric value. This is incorrect. Moreover, if the Department truly believes this, it should not

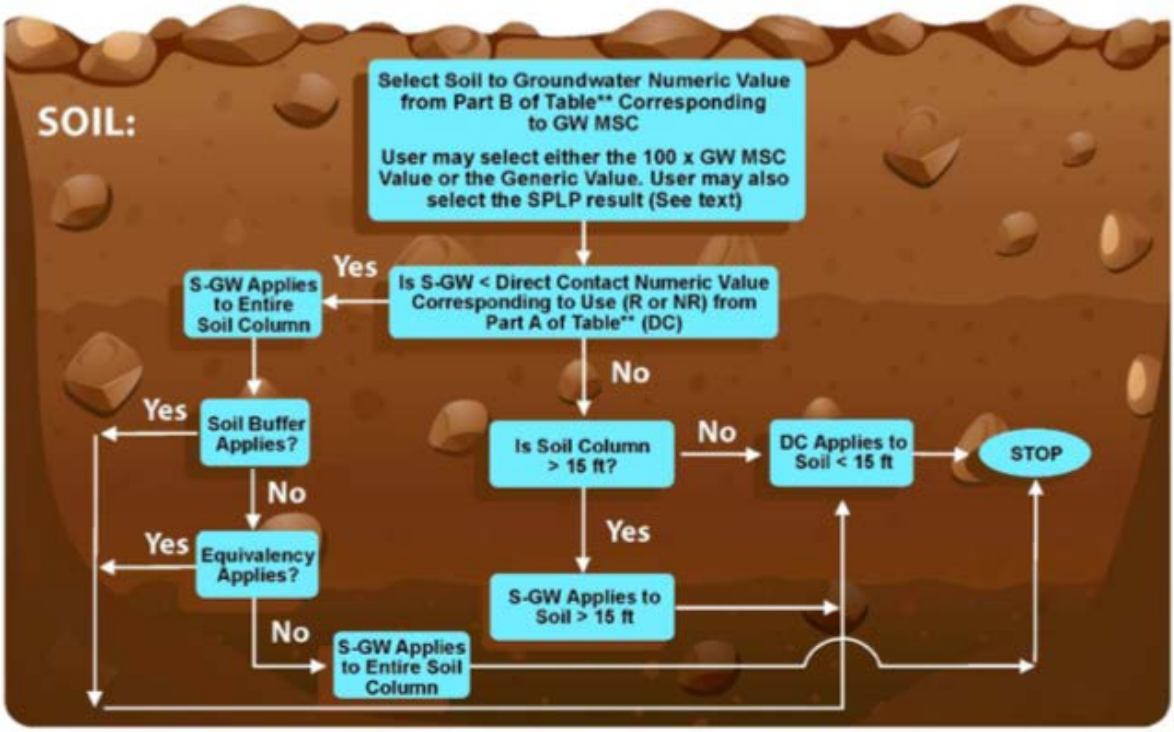
have any objection to not finalizing its proposed direct contact numeric value and retaining the current value of 1000 ppm in the regulations.

The source of the Department's position appears to be an email to the Southeast Regional Office relating to the remedial investigation at the Philadelphia oil refinery:

> Keep in mind that the non-residential direct contact numeric value will never be the MSC because it is higher than the generic soil to groundwater numeric value of 450 mg/kg. ***So in cases where the SHS is being used, the soil MSC for lead will always be 450 mg/kg***.

See Attachment 35, Email from Michael Maddigan, Environmental Group Manager (Land Recycling Program) to C. David Brown, Professional Geologist Manager (Southeast Regional Office), dated December 20, 2019 (bold italics added for emphasis). This statement framed the Department's erroneous press release relating to the proposed direct contact numeric value. *See* Department of Environmental Protection, Press Release, dated March 16, 2020 (Attachment 47), asserting that "[t]he non-residential statewide health standard of 450 ppm will remain unchanged."

The process of selecting statewide health standards is illustrated in the following decision tree [Figure II-11: Decision Tree for Selecting Statewide Health Standard MSCs for Groundwater and Soil)]



See Department of Environmental Protection, Technical Guidance Memorandum (revised January 19, 2019, Attachment 48), Section II (Act 2 Remediation Process), page II-52.

The Department is incorrect in asserting that a soil-to-groundwater numeric value will always prevail over a direct contact numeric value. In support of its argument, the Department relies on a subsection of the regulations that defines a medium-specific concentration as the lowest of three numbers -- the ingestion numeric value, the inhalation numeric value, and the soil-to-groundwater numeric value. *See* 25 Pa. Code §250.305(d)(1)(i)-(iii). But that is one-half the definition. The Department ignores the other half.

The other half of the definition defines a medium-specific concentration as the lowest of the first *two* numbers -- the ingestion numeric value and the inhalation numeric value, *without regard to the soil-to-groundwater numeric value*. *See id.*, §250.305(d)(2). To satisfy that other half of the definition, a remediator must perform a demonstration of the soil-to-groundwater pathway soil buffer or a soil-to-groundwater pathway equivalency demonstration. *See id.*, §250.305(d)(2)(i)-(iii).

The first demonstration involves a showing that "[t]he concentration of the regulated substance cannot exceed the limit related to the PQL [Practical quantitation limit] or background throughout the soil buffer," among other things. *See id.*, §250.308(b)(2). The soil buffer depth for lead is set at 10 feet. Department of Environmental Protection, Draft Chapter 250 rulemaking Table 4B (Attachment 10).

The second demonstration involves a showing that the regulated substances will not migrate to bedrock or the groundwater within 30 years at concentrations exceeding the greater of the groundwater medium-specific concentration or background in groundwater as the endpoint in soil pore water directly under the site, among other things. *See id.*, §250.308(d)(1).

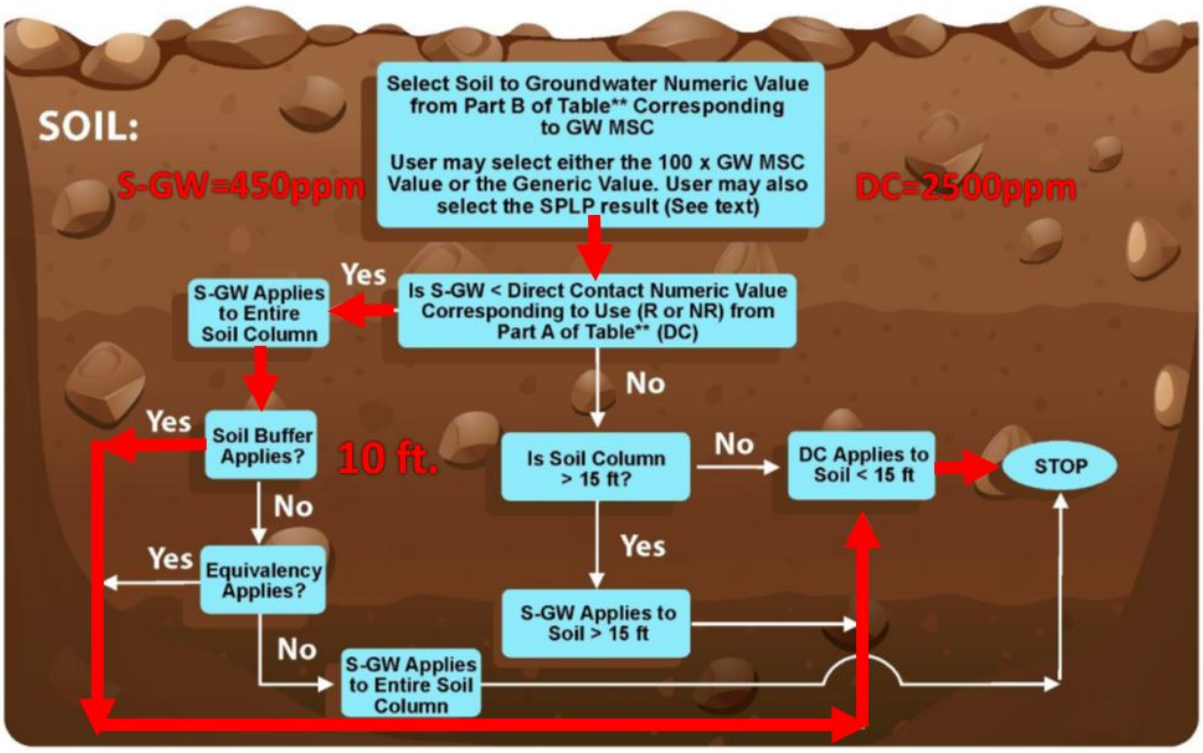
Assuming either demonstration is met, the soil-to-groundwater numeric value would not determine the medium-specific concentration. *See id.*, §250.305(d)(2).

In its own Technical Guidance Manual, the Department makes it clear that when either demonstration is met, the medium-specific concentration for soil will be the direct contact numeric value:

> ii) Determining Soil MSCs
>
> In determining the applicable soil standard, the remediator must compare the appropriate soil-to-groundwater numeric value to the direct contact numeric value for the corresponding depth interval within 15 feet from the ground surface. The lower of these two values is the applicable MSC for soil. ***If either the soil buffer distance (described in 25 Pa. Code § 250.308(b) and (c)) or the equivalency demonstration (described in 25 Pa. Code § 250.308(d)) is met, the soil-to-groundwater numeric value will be deemed to be satisfied, and the soil MSC will be the direct contact numeric value***. The soil-to-groundwater numeric value is the MSC

> for soil at depths below 15 feet, unless either the soil buffer distance or the equivalency demonstration is met.

See Department of Environmental Protection, Technical Guidance Memorandum (revised January 19, 2019, Attachment 48), Section II (Act 2 Remediation Process), page II-51 (bold italics added for emphasis).[3] To demonstrate how the direct contact numeric value of 2500 ppm for lead could apply, the Council has highlighted the following route in red below:



See id., page II-52 (arrows, lines, and text in red added for emphasis).

Therefore, there is no merit to the Department's argument that the proposed direct contact numeric value has no legal effect.

Moreover, it is presumed that when an agency proposes to do something, it intends some effect. In the past, the Department has told the Independent Regulatory Review Commission that its statewide health standards (including its direct contact numeric values) are important for the protection of public health:

> The Land Recycling Act requires the EQB to establish by regulation ***a uniform Statewide health standard that can be used to eliminate any substantial present or probable future risk to human health, welfare, and the environment***. The original standards were promulgated in 1997 and codified in Chapter 250.

[3] The document is on the Department's Web Page for Technical Guidance Manual.

> Section 104(a) of the Land Recycling Act explicitly recognizes that these standards would need to be updated over time as better science became available and as the need for clarification or enhancement of the program became apparent. ***Updating the standards serves the public, as DEP is able to use the most up-to-date health and scientific information to establish the cleanup standard for exposure to substances that cause cancer or have other toxic effects on human health or welfare***. The Statewide health standard is expressed as a list of MSCs, which apply to either soil or groundwater contamination and to residential and non-residential exposure scenarios as authorized under the Land Recycling Act.
>
> ***The changes in the MSCs in these amendments to Chapter 250 serve both the public and the regulated community as they provide clear information on what is required at contaminated sites***. Having access to that information allows the public to know the acceptable level of contamination at a site based on the intended use of the property, and it provides remediators with a uniform endpoint to the remediation process. ***Because each site and situation is unique, it is necessary to provide different MSCs for***: 1) specific constituents in groundwater at points of compliance, 2) ***specific constituents in soil, where there may be direct contact through ingestion or inhalation***, and 3) specific constituents in soil that may leech [sic] into groundwater. ***Each of these MSCs is based on the physical, toxicological, and esthetic properties of a specific regulated substance, which are based on scientific sources of information***.

Department of Environmental Protection, Regulatory Analysis Form, filed May 13, 2016, pages 2-3, Box No. 10 (Attachment 49. Bold italics added for emphasis).

If the Department feels compelled to come up with a number simply because it had to do so (as it has suggested), the Department should maintain the current direct contact numeric value of 1000 ppm.

5. <u>As a Matter of Law, the Proposed Direct Contact Numeric Value is Unreasonable</u>.

The Department has cherry-picked scientific information for the Adult Lead Methodology. It has used new scientific information that tends to make a standard less stringent (the baseline blood concentration) while ignoring other new scientific information that tends to make a standard more stringent (the target blood concentration). This is legally unreasonable.

It is significant that the target blood concentration is the only value in the EPA 2017 spreadsheet that the Department did *not* use when it calculated the proposed direct contact numeric value of 2500 ppm. *See* 50 Pa.B. 1097 (Appendix A, Table 7 ("Input Values Used in

the Adult Lead Model"); *see also* Spreadsheet for Calculation of PRGs: Appendix B of ALM document (2 pp, 18 K) (June 14, 2017, Attachment 33).

As a basis for its choice of a target blood concentration of 10 µg/dL, the Department apparently relies solely on the EPA guidance document from 2003, ignoring new scientific information reflected in the 2017 EPA guidance document and the 2017 EPA spreadsheet. The Department has not identified any other documentary justification as a basis for using 10 µg/dL.

The meeting minutes of the CSSAB do not contain any discussion of arguments for or against a target blood concentration of 10 µg/dL or 5 µg/dL. The minutes only state that the Department sought input regarding the choice between these target blood concentrations, and that the CSSAB recommended the less protective one. *See* Meeting Minutes (April 4, 2018, Attachment 3), Meeting Minutes (August 1, 2018, Attachment 5), Meeting Minutes (February 13, 2019, Attachment 7).

Apart from the EPA representative, the only academic representative on the CSSAB has a field of expertise outside of environmental remediation and public health. *See* Cleanup Standards Scientific Advisory Board Members, Membership List (Updated June 2018, Attachment 50) (Tina M. Serafini, D.Sc.). The other members are representatives of business and industry.

One member of the CSSAB who was present at all three meetings is a consultant who prepared remedial investigation reports for lead contamination for the Philadelphia oil refinery. *See* Colleen Costello, Linkedin Page (employed with GHD from March 2015-March 2020, Attachment 51). Her company performed ongoing work relating to the delineation of lead contamination in the soil and anticipated remedies under the site-specific standard for lead approved in 2015. *See* Colleen Costello, GHD, Remedial Investigation Report (November 21, 2017, Attachment 52), Section 9.6 ("AOI 6 areas with identified soil exceedances of the direct-contact MSC for BaP and benzene, with the exception of BH-16-025, and SSS for lead have been delineated and remedies will be addressed in future Act 2 submissions, including a Facility-Wide Cleanup Plan."); *see also* Colleen Costello, GHD, Letter to David Brown (April 30, 2018, Attachment 53), page 1 ("Additionally, lead in the area between BH-17-004 and the bulkhead will be assessed through Risk Assessment activities as presented in the site-wide Risk Assessment Report or the site-wide Cleanup Plan. Additional sampling is anticipated to support either the Risk Assessment or the Cleanup Plan activities."). In addition, another representative of GHD (who was not a member of the CSSAB) attended the second and third meetings.

Neither the CSSAB's recommendation of 10 µg/dL nor the Department's acceptance of the recommendation was credible. Given the science and the implementation of policy by federal and state health agencies, the selection of 10 µg/dL was unreasonable as a matter of law.

6. As a Matter of Law, the Proposed Direct Contact Numeric Value is "Not in Accordance with Law."

According to the Pennsylvania state courts, the pre-enforcement doctrine generally forecloses a party from immediately challenging a final rulemaking. However, such a party does not forfeit the right to challenge the regulation. When the regulation is implemented in such a manner as to cause harm, a party with standing may commence a legal challenge at that time. *See Rand v. Pennsylvania State Bd. of Optometry*, 762 A.2d 392 (Cmwlth., 2000) (regulation establishing a testing deadline to qualify for a license invalidly exceeded the agency's statutory authority, where the deadline was unnecessary to advance the intent of the act and therefore outside the grant of authority).

This is not an academic point. The proposed direct contact numeric value would have an effect on the remedial investigation at the Philadelphia oil refinery, either by setting a medium-specific concentration or by affecting a site-specific standard. If and when the Department makes another determination regarding the applicability of cleanup standards for that project, a party with standing will have the opportunity to challenge the proposed direct contact numeric value (if finalized) at that time.

On a number of accounts, the proposed direct contact numeric value is legally flawed. Because it violates a number of statutory and regulatory requirements, it is "not in accordance with law."

A. The proposed direct contact numeric value violates a number of statutory requirements.

A state court may strike down a regulation that is "not in accordance with law." *See* 2 Pa.C.S. § 704, Pennsylvania Consolidated Statutes, Title 2. Because the proposed direct contact numeric value violates a number of statutory requirements, it is "not in accordance with law."

According to the declaration of policy in the statute, "[a]ny remediation standards adopted by this Commonwealth must provide for the protection of public health and the environment." Act 2, § 102(3). As discussed above, the Department proposes a direct contact numeric value based on a target blood lead concentration that has been linked to serious and irreversible health effects. Because the proposed direct contact numeric value was calculated using this variable (as will almost all site-specific standards for lead), the resulting standards would not be protective of public health, causing them to violate this declaration of policy.

The declaration of policy also states that "[p]ublic health and environmental hazards cannot be eliminated without clear, predictable environmental remediation standards and a process for developing those standards." Act 2, §102(3). But the Department's presentation and discussion of the proposed direct contact numeric value has not been clear and predictable. The Department asserts that the proposed direct contact numeric value would have no legal effect, under the mistaken rationale that a much lower soil-to-groundwater value will always apply. In addition, it ignores the fact that it would have a significant legal effect by enabling property owners to develop site-specific standards near 2500 ppm, by endorsing a target blood

concentration that is two times the blood lead level used by public health agencies for dealing with children exposed to lead.

The lack of clarity is compounded by the fact that the Department did not include the target blood concentration of 10 µg/dL anywhere in the notice of the proposed rulemaking. It actually set forth "TBD" (presumably, "to be determined") as the target blood concentration in the proposed table. *See* 50 Pa.B. 1097 (Appendix A, Table 7 ("Input Values Used in the Adult Lead Model"). This makes it difficult for the public to recognize the connection between the proposed direct contact numeric value and site-specific standards for lead -- a connection that the Department has emphatically denied.

By asserting that the proposed direct contact numeric value is essentially meaningless, and by listing a key variable used to calculate that value as "TBD," the Department proposes a regulation that lacks "clear, predictable" standards, in violation of the declaration of policy in Act 2.

The statute also requires the Environmental Quality Board to promulgate Statewide health standards "along with the methods used to calculate" those standards." Act 2, §303(a) ("The Environmental Quality Board shall promulgate Statewide health standards for regulated substances for each environmental medium.... The Environmental Quality Board shall also promulgate along with the standards the methods used to calculate the standards."). Again, the Department does not identify the target blood concentration for determining the proposed direct contact numeric value of 2500 ppm. Rather, it merely identifies it as "TBD." *See* 50 Pa.B. 1097 (Appendix A, Table 7). The fact that the Council was able to deduce that the Department is using a 10 µg/dL target blood concentration does not excuse this violation of the statute.

The statute requires the direct contact numeric value to be based on "valid scientific methods." *See* Act 2, §303(b)(5) ("For the nonresidential standard, the concentration of a regulated substance in soil shall not exceed either the direct contact soil medium-specific concentration based on nonresidential exposure factors within a depth of up to 15 feet from the existing ground surface using valid scientific methods reflecting worker exposure or the soil-to-groundwater pathway numeric value determined in accordance with paragraph (4)"). The Department's use of EPA's model with only *some* of EPA's updated default variables makes this proposal scientifically invalid and, therefore a violation of Act 2.

The statute also requires that exposure scenarios for medium-specific concentrations for nonresidential conditions be based on "valid scientific methods." *Id.*, §303(b)(6) ("Exposure scenarios for medium-specific concentrations for nonresidential conditions shall be established using valid scientific methods reflecting worker exposure."). For the same reason as above, the proposal violates this requirement.

Finally, the statute requires site-specific standards to be based on "sound scientific principles." *Id.*, §304(e) ("Concentrations of regulated substances in soil shall not exceed values calculated in accordance with subsections (b) and (c) based on human ingestion of soil where direct contact exposure to the soil may reasonably occur; .... Such determinations … shall be based on sound scientific principles …."). The proposal enables property owners to violate this

requirement by endorsing the use of methods and variables that are based on outdated information.

B. The proposed direct contact numeric value violates existing regulations.

The Department is required to "review new scientific information that relates to the basis of the MSCs as it becomes available" and "propose appropriate changes for the consideration of the EQB as necessary." 25 Pa. Code §250.11. The proposal violates this requirement by *ignoring* new scientific data and by proposing a change to the nonresidential direct contact value for lead based on outdated information.

A person is required to "implement a remedy under the Statewide health standard that is protective of human health and the environment." 25 Pa. Code §250.305(a). As discussed above, the proposed nonresidential direct contact value is not protective of human health. The proposal enables parties remediating a site to a Statewide health standard or site-specific standard to implement a remedy that violates the regulation.

For all these reasons, the proposal is unreasonable, violates statutory and regulatory requirements, and would not survive a legal challenge under 2 Pa.C.S. § 704.

Conclusion

The Department should not finalize the proposed direct contact numeric value of 2500 ppm. It should retain the current value of 1000 ppm.

Thank you for your consideration of the Council's comments.

Sincerely,

Joseph Otis Minott, Esq.

From: Mira Treatman
To: Philly Refinery Cleanup
Subject: Comments on AOI 1-11, Lead Report, & Outreach Plan
Date: Thursday, January 14, 2021 2:53:25 PM

Evergreen Resources,

There are three sections of comments I would like to submit as part of the 120-day comment period that began on August 28, 2020: Process Comments, Issue Comments, and Unaddressed issues.

Comments on Community Outreach Plan:
- Evergreen has refused to provide “meaningful public involvement” in the Act 2 processes. The Public Involvement Process (PIP) is inadequate.
- Evergreen has not provided sufficient time following explanations for the community to digest the information provided. 120 days is insufficient.
- Evergreen has refused to address issues of concern to the community in ways that relate to the people rather than just the Act 2 requirements.
- Air quality measurements were made within existing buildings, but no air quality data was collected in surrounding neighborhoods or onsite at contaminated locations.

Comments on Contaminants of Concern:
- Lead - High levels of lead are present at multiple locations. PADEP is allowing Evergreen to use a “site-specific lead standard” of 2240 PPM even though the statewide health limit is 1000 PPM.
- Benzene - High levels of benzene are present extensively at the site, and benzene is currently being emitted into the atmosphere.
- MBTE - Methyl Tert-butyl Ether (MTBE) is present in concentrations that are over 100 times higher than the state-wide health standard.
- Locations and concentrations of 30 contaminants of concern - including chrysene, naphthalene, mercury, and arsenic - were identified individually but their cumulative significance was not addressed.
- Over its lifespan, this refinery used over a hundred chemical compounds. Why are only 30 of these sampled for on site? What is the rationale for not sampling the others?
- Deep Aquifer - Evergreen states a layer of clay and mud partly separates the upper, “water table” aquifer from a lower, “deep” aquifer. This barrier is not continuous, though, and fails to protect the deep aquifer from contamination. Since the deep aquifer supplies drinking water to communities in New Jersey, Evergreen needs to specify the actions it will take to investigate and clean up any contamination affecting the deep aquifer and public water supplies.

Comments on Unaddressed Issues:
- Current Conditions - Investigation information is out of date; some data was collected over a decade ago. Accurate, current conditions must be understood, using recent data, to develop appropriate remediation plans.

- Off-Site Contamination - Benzene pools extend beyond the property fence line but have not been mapped. Evergreen fails to acknowledge potential responsibility for cleaning up off-site contamination of benzene or other contaminants.
- Water Treatment - Evergreen has described petrochemical recovery results. But information has not been provided about how contamination conditions have changed over time or what the current situation is. Hilco plans to replace the existing systems, but no information has been provided as to what or why such replacement is appropriate.
- PFAS - Fire fighting and training exercises have released PFAS (“forever carcinogens”) at the site. Evergreen ignores this legacy and recent contamination. PFAS should be sampled for and included in remediation planning and activities.

Dear Mr. Patel and Evergreen Resources Group Managers,

Attached with this message, please find State Senator Nikil Saval's comments for submission on the proposed site-specific lead levels at the former Philadelphia Energy Solutions refinery site.

We appreciate your consideration of requests to amend the proposed lead levels. Please don't hesitate to be in touch with any questions or concerns.

Sincerely,
Natasha

Subject: Comments on the plan for cleanup of the Philly refinery
Date: Thursday, January 14, 2021 5:52:00 PM

Evergreen Resources,

To whom it may concern:

I was in Philadelphia on 19 June 2019. I remember the fear of not knowing whether my child's friends in the area were alive after the explosions. We didn't learn how much danger my two children and I had been in until four months later, when the Chemical Safety Board reported on the release of hydrofluoric acid from the site.

The harm the refinery caused while it was in operation has been well documented. Fenceline residents are already dealing with the short- and long-term health and economic costs of the refinery's past operation.
