1.0 INTRODUCTION

Leidos, Inc. (Leidos) has prepared this Groundwater Sampling Report (Report) for the Philadelphia Gas Works (PGW) to summarize and document the June 2016 monitoring well gauging, groundwater sampling, and related tasks conducted at the PGW Passyunk Facility (Site). The Site is located at 3100 West Passyunk Avenue, Philadelphia, Pennsylvania (**Figure 1**). **Figure 2** shows the groundwater monitoring well locations with reference to an aerial photograph.

1.1 Site Background

The Site is approximately 64 acres and is located in an area of mixed industrial, commercial, and residential uses. The Site is bounded by Passyunk Avenue to the south; Philadelphia Energy Solutions, LLC (PES) property to the north; the Schuylkill River and PES property to the west; and residential/commercial properties to the east. The Site has been owned and operated by PGW for over 100 years and has been used to manufacture, process, store, and distribute natural gas. The Site is currently used for liquefied natural gas (LNG) storage, vaporization, and gas distribution. In addition, the Site includes laboratory facilities, fleet maintenance, fueling, and parking.

Previous investigations by Weston Solutions, Inc. (Weston) and others have identified the presence of volatile and semi-volatile organic compounds (VOCs and SVOCs) and metals in soil and groundwater at concentrations above Pennsylvania Department of Environmental Protection (PADEP) medium-specific concentrations (MSC). In addition, phase-separated hydrocarbons (product) have been detected in groundwater, and PGW is currently operating a product recovery system.

The Site is in the process of voluntary remediation and monitoring in general accordance with Pennsylvania's Land Recycling and Environmental Remediation Standards Act (Act 2). As part of the process, PGW is seeking to determine site-specific cleanup goals for the Site. The current investigation is intended to assess the contaminant concentrations at pertinent Site wells.

1.2 Site Topographic and Hydrogeologic Characteristics

Site topography is generally flat with a gentle slope toward the Schuylkill River. Ground surface elevations are between approximately 20 to 40 feet above mean sea level (ft amsl). The Site is located in the Atlantic Coastal Plain physiographic province and is underlain by the Trenton Gravel Formation. Site investigations observed a soil profile (0 to 10 feet [ft]) comprised of fill material, sandy to silty sediments, and soils. Deeper sediments consist of unconsolidated, interbedded, gravel, sand, silt, and clay.

Recent depth-to-groundwater measurements range from approximately 21 to 34 feet below the top of the inner casing (ft TIC) with resulting groundwater elevations of approximately 1.5 to 11 ft amsl. Data indicate the hydraulic gradient in the shallow aquifer generally trends southwest toward the Schuylkill River. Data from the deeper wells indicate the hydraulic gradient in the deeper aquifer trends southwest toward the Schuylkill River.

1.3 Scope of Work

This Report presents and summarizes the groundwater gauging and groundwater sampling event conducted between June 20 and 21, 2016.

2.0 METHODOLOGY

2.1 Monitoring Well Gauging

During groundwater sampling activities on June 20 and 21, 2016, Leidos gauged the depth to water at the following monitoring well network:

- MW-1D & MW-1S
- MW-2D & MW-2S
- MW-3D & MW-3S
- MW-4S
- MW-5S
- MW-6S
- MW-7S
- MW-10S
- MW-11S
- MW-12D & MW-12S
- MW-42D & MW-42R

Wells with high historical concentrations of hydrocarbon contamination and/or wells with organic vapor odors were screened for product with an interphase probe. The depth to groundwater and total well depth were measured at each well with an electronic water level meter. Total depths were compared to historical data to determine whether well development was warranted. Well total depths and groundwater depths were recorded in field logbooks.

2.2 Groundwater Sampling

After monitoring and recording groundwater depth, the wells were purged and sampled via low-flow methodology in general accordance with the guidance provided in the PADEP Groundwater Monitoring Guidance Manual (2001) and the United States Environmental Protection Agency (USEPA) Region I Low Stress Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells (1996). Groundwater samples were submitted to Eurofins Lancaster Laboratories, LLC for analysis of dissolved metals via USEPA Method SW-846 6010B/7000 Series, VOCs via USEPA Method SW-846 8260B, and SVOCs via USEPA Method SW-846 8270C. Quality assurance/quality control (QA/QC) samples included a duplicate sample, a rinse blank sample, and a trip blank sample.

2.3 Investigation-Derived Waste

Purge water derived from sampling was collected in 55-gallon drums and stored onsite pending future offsite disposal. Each drum was labeled with pertinent project details including date, contents, and generator contact information. The drums were placed on secondary containment with a capacity of approximately 110 percent total drum volume.

3.0 RESULTS

3.1 Monitoring Well Gauging

During the gauging event, product was not detected in any Site well. Measured total depths did not indicate the need for sediment removal and/or well development. **Table 1** below presents the results of the monitoring well gauging. Groundwater elevations and inferred elevation contours are presented for the shallow and deep aquifers on **Figures 3** and **4**. Field data collected during monitoring well gauging and sampling are included in **Appendix A**.

Purge water from wells MW-1D, MW-1S, MW-3S, MW-4S, MW-6S, MW-7S, MW-10S, and MW-12S was segregated and placed in a 55-gallon drum inside of a drum over-pack. Purge water and IDW fluids from other wells were stored in separate 55-gallon drums. IDW was removed from the Site by Veolia on July 25, 2016.

4.0 CONCLUSIONS, RECOMMENDATIONS, AND FUTURE ACTIVITIES

4.1 Conclusions and Recommendations

Sample results indicate concentrations greater than applicable MSCs for VOCs, SVOCs, and dissolved metals at multiple wells. Based on the compounds and concentrations detected, it is likely that benzene will serve as the primary driver for regulatory closure of the groundwater concern. Of the VOCs detected, benzene has one of the lowest MSCs, and multiple samples exceeded the MSC for used aquifers and non-used aquifers. Furthermore, most of the wells with SVOCs and dissolved metals concentrations greater than MSCs also had benzene concentrations greater than the MSC.

The June 2016 analytical results are similar to previous sampling events with a few exceptions. Benzene concentrations at MW-1D, MW-1S, MW-10S, and MW-12S have declined substantially since March 2016, while concentrations at MW-3S have increased considerably. Ethylbenzene concentrations at MW-1S, MW-4S, MW-6S, MW-7S, MW-10S, MW-11S, and MW-12S have declined since March 2016, while concentrations have increased slightly at MW-2S, MW-3S, and MW-42R. Overall, xylenes concentrations have decreased since March 2016. Naphthalene concentrations at MW-7S, MW-10S, and MW-11S have declined substantially while concentrations in MW-2S and MW-42R have more than doubled. Current metals analyses indicate arsenic and lead have shown an overall decline in frequency and concentration since March 2016, while cadmium results show an increase in concentration in MW-2D.

Leidos recommends continued groundwater monitoring to establish long-term trends in contaminant concentrations.

4.2 Future Activities

The next quarterly sampling event is scheduled for September 2016. No additional activities are currently planned for this Site.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:**SW-846 8260B, GC/MS volatiles**

Batch #: N161832AA (Sample number(s): 8439791)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: Acetone

Batch #: T161831AA (Sample number(s): 8439784-8439788, 8439790, 8439792, 8439796-8439798, 8439800-8439802 UNSPK: 8439788)

The recovery(ies) for the following analyte(s) in the LCS exceeded the acceptance window indicating a positive bias: 1,2-Dichloroethane

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Chloroform, 1,1,1-Trichloroethane, Carbon Tetrachloride, 1,2-Dichloroethane, Bromodichloromethane, Vinyl Chloride, Chloroethane, trans-1,2-Dichloroethene, 1,1-Dichloroethane, Trichloroethene, 1,2-Dichloropropane, Toluene, Dibromochloromethane, Ethylbenzene, trans-1,3-Dichloropropene, Xylene (Total)

SW-846 8270C, GC/MS Semivolatiles

Sample #s: 8439784

The recovery for the sample surrogate(s) is outside the QC acceptance limits as noted on the QC Summary. Sufficient sample was not available to repeat the analysis.

Sample #s: 8439785, 8439787, 8439789, 8439799

The recovery for the sample surrogate(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:

The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.

Batch #: 16176WAA026 (Sample number(s): 8439784-8439801)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8439784, 8439785, 8439787, 8439788, 8439789, 8439797, 8439799

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	BMQL	Below Minimum Quantitation Level
N.D.	none detected	MPN	Most Probable Number
TNTC	Too Numerous To Count	CP Units	cobalt-chloroplatinate units
IU	International Units	NTU	nephelometric turbidity units
umhos/cm	micromhos/cm	ng	nanogram(s)
C	degrees Celsius	F	degrees Fahrenheit
meq	milliequivalents	lb.	pound(s)
g	gram(s)	kg	kilogram(s)
µg	microgram(s)	mg	milligram(s)
mL	milliliter(s)	L	liter(s)
m³	cubic meter(s)	µL	microliter(s)
		pg/L	picogram/liter
<	less than		
>	greater than		
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.		
ppb	parts per billion		
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.		

Laboratory Data Qualifiers:

- B - Analyte detected in the blank
- C - Result confirmed by reanalysis
- E - Concentration exceeds the calibration range
- J (or G, I, X) - estimated value \geq the Method Detection Limit (MDL or DL) and $<$ the Limit of Quantitation (LOQ or RL)
- P - Concentration difference between the primary and confirmation column $>40\%$. The lower result is reported.
- U - Analyte was not detected at the value indicated
- V - Concentration difference between the primary and confirmation column $>100\%$. The reporting limit is raised due to this disparity and evident interference...

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods. Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" are not performed within 15 minutes.
