The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Analytical test results meet all requirements of the associated regulatory program (e.g., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis. Data qualifiers are applied to note exceptions. Noncompliant quality control (QC) is further explained in narrative comments.
· QC results that exceed the upper limits and are associated with non-detect samples are qualified but further narration is not required since the bias is high and does not change a non-detect result. Further narration is also not required with QC blank detection when the associated sample concentration is non-detect or more than ten times the level in the blank.
· Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD is performed, unless otherwise specified in the method.
· Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.
Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" and tested in the laboratory are not performed within 15 minutes of collection.

This report shall not be reproduced except in full, without the written approval of the laboratory.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. The foregoing express warranty is exclusive and is given in lieu of all other warranties, expressed or implied, except as otherwise agreed. We disclaim any other warranties, expressed or implied, including a warranty of fitness for particular purpose and warranty of merchantability. In no event shall Eurofins Lancaster Laboratories Environmental, LLC be liable for indirect, special, consequential, or incidental damages including, but not limited to, damages for loss of profit or goodwill regardless of (A) the negligence (either sole or concurrent) of Eurofins Lancaster Laboratories Environmental and (B) whether Eurofins Lancaster Laboratories Environmental has been informed of the possibility of such damages. We accept no legal responsibility for the purposes for which the client uses the test results. Except as otherwise agreed, no purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Definitions/Glossary

Client: Stantec Consulting Corp. Job ID: 410-61414-1
Project/Site: Belmont Terminal GW Sampling

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
!	Laboratory is not accredited for this parameter.
FL	MS and/or MSD recovery below control limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
1C	Result is from the primary column on a dual-column method.
2C	Result is from the confirmation column on a dual-column method.
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 410-61414-1

Laboratory: Eurofins Lancaster Laboratories Env, LLC

Narrative

Job Narrative
410-61414-1

Receipt
The sample was received on 11/1/2021 3:55 PM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.3°C

Receipt Exceptions
A trip blank was not submitted for analysis with this sample shipment; and was not listed on the Chain of Custody (COC).

GC/MS Semi VOA
Method 8270D: The following sample was diluted due to the nature of the sample matrix: OW-19_20211101 (410-61414-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

HPLC/IC
Method 300_ORGFM_28D: The following sample was diluted due to the abundance of non-target analytes: OW-19_20211101 (410-61414-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 5310C: The reference method requires samples to be preserved to a pH of <2. The following sample(s) were received with insufficient preservation at a pH of 5: OW-19_20211101 (410-61414-1). The sample(s) were preserved to the appropriate pH in the laboratory.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Accreditation/Certification Summary

Client: Stantec Consulting Corp. Job ID: 410-61414-1
Project/Site: Belmont Terminal GW Sampling

Laboratory: Eurofins Lancaster Laboratories Env, LLC

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Pennsylvania	NELAP	36-00037	01-31-22

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
5310 B-2011		Water	Total Carbon
SM5310C		Water	Total Inorganic Carbon

Laboratory: Eurofins TestAmerica, Pensacola

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Case Narrative

Project: 20210504_STANTEC

Client Project ID: CQ#0139_Former Philadelphia Refinery Annual GWS

Client: Evergreen c/o Stantec

FIU QC Batch No: M2486

SDG #: M2105B

Date: June 10, 2021

General Information:
10 samples arrived on 05/04/2021 and were analyzed for Sucralose using EARL SOP-2014-O-130.1.

Samples were received in acceptable condition with any exceptions noted below.

Sample Receipt:

Samples were received at room temperature.

Holding Time:

Samples were analyzed within the allowable holding time of 30 days as specified in EARL SOP-2014-O-130.1.

Sample Storage:

Samples were stored in a freezer at < -20°C until sample preparation / analysis.

Initial Calibrations:

All criteria were within EARL SOP-2014-O-130.1 method requirements (r^2>0.99).

Continuing Calibration Verification:

All criteria were within method requirements (the measured concentration should not deviate more than 30% from the assigned value, for all analytes). With any exceptions noted below.

Laboratory Reagent Blank (LRB):

All analytes were below the method detection limit in the LRB with any exceptions noted below.

Laboratory Fortified Blank (LFB) and LFB Duplicate:

All Laboratory Fortified Blank compounds were within EARL SOP-2014-O-130.1 method requirements (70%-130% recovery), with any exceptions noted below.

All Laboratory Fortified Blank RPD were within EARL SOP-2014-O-130.1 method requirements (≤ 30% RPD) with any exceptions noted below.

Laboratory Fortified Matrix (LFM):

All Laboratory Fortified Matrix compounds were within EARL SOP-2014-O-130.1 method requirements (70%-130% recovery), with any exceptions noted below.

Sample Duplicate:

All Duplicate Samples above MDL were within EARL SOP-2014-O-130.1 method requirements (<30% RPD) with any exceptions noted below.

ICVS:

Analysis of ICVS was within EARL SOP-2014-O-130.1 method requirements (Recovery within 70-130%) with any exceptions noted below.

Case Narrative

Project: 20210514_STANTEC

Client Project ID: CQ#0139_Former Philadelphia Refinery Annual GWS

Client: Evergreen c/o Stantec

FIU QC Batch No: M2489-M2491

SDG #: M2105C, M2105D

Date: June 25, 2021

General Information:

23 samples arrived on 05/14/21 and 14 samples arrived on 05/20/2021. They were analyzed for Sucralose using EARL SOP-2014-O-130.1.

Samples were received in acceptable condition with any exceptions noted below.

Sample Receipt:

Samples were received at frozen.

Holding Time:

Samples were analyzed within the allowable holding time of 30 days as specified in EARL SOP-2014-O-130.1.

Sample Storage:

Samples were stored in a freezer at < -20°C until sample preparation / analysis.

Initial Calibrations:

All criteria were within EARL SOP-2014-O-130.1 method requirements (r^2>0.99).

Continuing Calibration Verification:

All criteria were within method requirements (the measured concentration should not deviate more than 30% from the assigned value, for all analytes). With any exceptions noted below.

Laboratory Reagent Blank (LRB):

All analytes were below the method detection limit in the LRB with any exceptions noted below.

Laboratory Fortified Blank (LFB) and LFB Duplicate:

All Laboratory Fortified Blank compounds were within EARL SOP-2014-O-130.1 method requirements (70%-130% recovery), with any exceptions noted below.

All Laboratory Fortified Blank RPD were within EARL SOP-2014-O-130.1 method requirements (≤ 30% RPD) with any exceptions noted below.

Laboratory Fortified Matrix (LFM):

All Laboratory Fortified Matrix compounds were within EARL SOP-2014-O-130.1 method requirements (70%-130% recovery), with any exceptions noted below.

Matrix spike was not analyzed for batch M2491 due to a miss-spike. Instrument malfunctioned afterwards and sample re-run was not acquired.

Sample Duplicate:

All Duplicate Samples above MDL were within EARL SOP-2014-O-130.1 method requirements (<30% RPD) with any exceptions noted below.

RPD for duplicate samples S-115SRTF was outside the quality control criteria but sample results were below the MDL.

ICVS:

Analysis of ICVS was within EARL SOP-2014-O-130.1 method requirements (Recovery within 70-130%) with any exceptions noted below.

Additional Comments:

Recovery of the internal standard for all samples was low when analyzed at full strenghth; therefore, different dilutions were used in order to get an acceptable percent recovery.

MICROBAC®

Genomic Sequencing Report

Microbac Oak Ridge WO# Z1B0085-01 **3/17/2021**

Client: Stantec

Sample Project: PHL-Belmont Terminal Drilling Sampling

Sample ID: BT-11A-W-29-20210210

Summary:

- There were 5.812 Million reads for this sample and the file size was 1.15 GiB.
- There were 73 identifications (ID's) in the bacterial data set.
- There was 1 identification in the antibiotic resistance data set.
- There were 6 identifications in the fungal data set.
- There were 2 identifications in the protists data set.
- There were 174 identifications in the Dark Matter data set.
- There was 1 identification in the phages data set.
- There was 1 identification in the virus data set.
- There were 4 virulence factors identified in the data set.

The Oak Ridge Microbac laboratory uses the CosmosID bioinformatics pipeline and cloud computing platform for analysis and report generation. The report consists of tables and figures for bacteria, antibiotic resistance genes, fungi, protists, phages, viruses, and virulence genes.

Report Definitions

- **Name:** The name for the organism or taxonomic level or the name of the antibiotic resistance gene or virulence factor.
- **Calls at different taxonomic levels:** In the results there may be some calls at sub-species or strain level and others at species or genus level or higher. CosmosID calls the lowest level possible based on the identification of unique kmers that match the reference genomes. If identification was not possible at strain level, for example, there will be a try to make an identification at species level etc.
- **Tax ID:** The tax id is the NCBI taxonomic id for the organism.
- **Frequency:** The number of unique kmer occurrences in the queried sample. This is roughly equivalent to the number of reads that matched to the organism identified.

- **Unique Matches:** Unique matches percent is the amount of unique kmers that were found in the sample for an organism out of the total possible number of kmers in the database that are unique to that organism.
- **Total Matches:** The shared plus unique matches divided by the pre-calculated shared plus unique matches possible in the reference database.
- **Relative Abundance:** Relative abundance is calculated based on the number of organism specific kmers and their observed frequency in the sample and then normalized to represent the abundance of each organism.

MICROBAC®

Genomic Sequencing Report

Microbac Oak Ridge WO# Z1B0085-02 **3/17/2021**

Client: Stantec

Sample Project: PHL- Belmont Terminal Drilling Sampling

Sample ID: BT-17A-W-83-20210210

Summary:

- There were 3.84 Million reads for this sample and the file size was 790.5 MiB.
- There were 120 identifications (ID's) in the bacterial data set.
- There was 1 identification in the antibiotic resistance data set.
- There were 8 identifications in the fungal data set.
- There were 2 identifications in the protists data set.
- There were 75 identifications in the Dark Matter data set.
- There were 4 identifications in the phages data set.
- There were 0 identifications in the virus data set.
- There were 14 virulence factors identified in the data set.

The Oak Ridge Microbac laboratory uses the CosmosID bioinformatics pipeline and cloud computing platform for analysis and report generation. The report consists of tables and figures for bacteria, antibiotic resistance genes, fungi, protists, phages, viruses, and virulence genes.

Report Definitions

- **Name:** The name for the organism or taxonomic level or the name of the antibiotic resistance gene or virulence factor.
- **Calls at different taxonomic levels:** In the results there may be some calls at sub-species or strain level and others at species or genus level or higher. CosmosID calls the lowest level possible based on the identification of unique kmers that match the reference genomes. If identification was not possible at strain level, for example, there will be a try to make an identification at species level etc.
- **Tax ID:** The tax id is the NCBI taxonomic id for the organism.
- **Frequency:** The number of unique kmer occurrences in the queried sample. This is roughly equivalent to the number of reads that matched to the organism identified.

- **Unique Matches:** Unique matches percent is the amount of unique kmers that were found in the sample for an organism out of the total possible number of kmers in the database that are unique to that organism.
- **Total Matches:** The shared plus unique matches divided by the pre-calculated shared plus unique matches possible in the reference database.
- **Relative Abundance:** Relative abundance is calculated based on the number of organism specific kmers and their observed frequency in the sample and then normalized to represent the abundance of each organism.

Genomic Sequencing Report

Microbac Oak Ridge WO# Z1B0085-03 **3/17/2021**

Client: Stantec

Sample Project: PHL- Belmont Terminal Drilling Sampling

Sample ID: BT-17B-W-43-20210210

Summary:

- There were 4.102 Million reads for this sample and the file size was 839.9 MiB.
- There were 167 identifications (ID's) in the bacterial data set.
- There were 2 identifications in the antibiotic resistance data set.
- There were 8 identifications in the fungal data set.
- There were 4 identifications in the protists data set.
- There were 201 identifications in the Dark Matter data set.
- There were 4 identifications in the phages data set.
- There were 0 identifications in the virus data set.
- There were 21 virulence factors identified in the data set.

The Oak Ridge Microbac laboratory uses the CosmosID bioinformatics pipeline and cloud computing platform for analysis and report generation. The report consists of tables and figures for bacteria, antibiotic resistance genes, fungi, protists, phages, viruses, and virulence genes.

Report Definitions

- **Name:** The name for the organism or taxonomic level or the name of the antibiotic resistance gene or virulence factor.
- **Calls at different taxonomic levels:** In the results there may be some calls at sub-species or strain level and others at species or genus level or higher. CosmosID calls the lowest level possible based on the identification of unique kmers that match the reference genomes. If identification was not possible at strain level, for example, there will be a try to make an identification at species level etc.
- **Tax ID:** The tax id is the NCBI taxonomic id for the organism.
- **Frequency:** The number of unique kmer occurrences in the queried sample. This is roughly equivalent to the number of reads that matched to the organism identified.

- **Unique Matches:** Unique matches percent is the amount of unique kmers that were found in the sample for an organism out of the total possible number of kmers in the database that are unique to that organism.
- **Total Matches:** The shared plus unique matches divided by the pre-calculated shared plus unique matches possible in the reference database.
- **Relative Abundance:** Relative abundance is calculated based on the number of organism specific kmers and their observed frequency in the sample and then normalized to represent the abundance of each organism.

Genomic Sequencing Report

Microbac Oak Ridge WO# Z1B0090-01 **3/17/2021**

Client: Stantec

Sample Project: PHL- Belmont Terminal Drilling Sampling

Sample ID: BT-18A-W-41-20210210

Summary:

- There were 4.191 Million reads for this sample and the file size was 855.88 MiB.
- There were 185 identifications (ID's) in the bacterial data set.
- There were 3 identifications in the antibiotic resistance data set.
- There were 12 identifications in the fungal data set.
- There were 4 identifications in the protists data set.
- There were 147 identifications in the Dark Matter data set.
- There were 21 identifications in the phages data set.
- There were 0 identifications in the virus data set.
- There were 18 virulence factors identified in the data set.

The Oak Ridge Microbac laboratory uses the CosmosID bioinformatics pipeline and cloud computing platform for analysis and report generation. The report consists of tables and figures for bacteria, antibiotic resistance genes, fungi, protists, phages, viruses, and virulence genes.

Report Definitions

- **Name:** The name for the organism or taxonomic level or the name of the antibiotic resistance gene or virulence factor.
- **Calls at different taxonomic levels:** In the results there may be some calls at sub-species or strain level and others at species or genus level or higher. CosmosID calls the lowest level possible based on the identification of unique kmers that match the reference genomes. If identification was not possible at strain level, for example, there will be a try to make an identification at species level etc.
- **Tax ID:** The tax id is the NCBI taxonomic id for the organism.
- **Frequency:** The number of unique kmer occurrences in the queried sample. This is roughly equivalent to the number of reads that matched to the organism identified.

- **Unique Matches:** Unique matches percent is the amount of unique kmers that were found in the sample for an organism out of the total possible number of kmers in the database that are unique to that organism.
- **Total Matches:** The shared plus unique matches divided by the pre-calculated shared plus unique matches possible in the reference database.
- **Relative Abundance:** Relative abundance is calculated based on the number of organism specific kmers and their observed frequency in the sample and then normalized to represent the abundance of each organism.

Genomic Sequencing Report

Microbac Oak Ridge WO# Z1B0090-03 **3/17/2021**

Client: Stantec

Sample Project: PHL- Belmont Terminal Drilling Sampling

Sample ID: BT-14-W-65-20210210

Summary:

- There were 5.476 Million reads for this sample and the file size was 1.09 GiB.
- There were 169 identifications (ID's) in the bacterial data set.
- There were 4 identifications in the antibiotic resistance data set.
- There were 14 identifications in the fungal data set.
- There were 8 identifications in the protists data set.
- There were 84 identifications in the Dark Matter data set.
- There were 4 identifications in the phages data set.
- There were 0 identifications in the virus data set.
- There were 18 virulence factors identified in the data set.

The Oak Ridge Microbac laboratory uses the CosmosID bioinformatics pipeline and cloud computing platform for analysis and report generation. The report consists of tables and figures for bacteria, antibiotic resistance genes, fungi, protists, phages, viruses, and virulence genes.

Report Definitions

- **Name:** The name for the organism or taxonomic level or the name of the antibiotic resistance gene or virulence factor.
- **Calls at different taxonomic levels:** In the results there may be some calls at sub-species or strain level and others at species or genus level or higher. CosmosID calls the lowest level possible based on the identification of unique kmers that match the reference genomes. If identification was not possible at strain level, for example, there will be a try to make an identification at species level etc.
- **Tax ID:** The tax id is the NCBI taxonomic id for the organism.
- **Frequency:** The number of unique kmer occurrences in the queried sample. This is roughly equivalent to the number of reads that matched to the organism identified.

- **Unique Matches:** Unique matches percent is the amount of unique kmers that were found in the sample for an organism out of the total possible number of kmers in the database that are unique to that organism.
- **Total Matches:** The shared plus unique matches divided by the pre-calculated shared plus unique matches possible in the reference database.
- **Relative Abundance:** Relative abundance is calculated based on the number of organism specific kmers and their observed frequency in the sample and then normalized to represent the abundance of each organism.

A Evergreen Field Procedures Manual

1.0 INTRODUCTION

This Quality Assurance/Quality Control Plan and Field Procedures Manual (QA/QC Plan) outlines the procedures developed to ensure the collection and analysis of quality data for investigations completed under the United States Environmental Protection Agency (USEPA) Resource Conservation and Recovery Act (RCRA), Pennsylvania Department of Environmental Protection (PADEP) Act 2, and Pennsylvania and Delaware's Tank programs at the Sunoco Partners Marketing and Terminals, LP (Sunoco Partners) Marcus Hook Industrial Complex (MHIC) and the Philadelphia Energy Solutions Refining and Marketing, LLC (PES) Philadelphia Refinery Complex (PRC) on behalf of Evergreen Resources Management Operations (Evergreen). This document shall be used in conjunction with the site-specific work plans developed for each site and Standard Operating Procedures (SOPs) for field work as incorporated as Appendix A of this QA/QC Plan.

The QA/QC Plan is a planning document that provides a "blueprint" for obtaining the type and quality of data needed to support environmental decision making. The QA/QC Plan integrates relevant technical and quality aspects of a project and documents quality assurance and quality control.

The selection criteria and evaluation specified in this document will be used for validating the data in accordance with the USEPA Guidance on Environmental Data Verification and Data Validation (USEPA 240-R-02-004), dated November 2002 (EPA QA/G-8), USEPA Contract Laboratory Program National Functional Guidelines (NFGs) for Superfund Organic Methods Data Review (USEPA 540-R-08-01), dated June 2008 (SOM02.2) and USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (USEPA 540-R-10-011), dated January 2010 (ISM02.2). Qualifiers assigned to the data will be consistent with the data qualifiers specified in the NFGs and the USEPA Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use (USEPA 540-R-08-01), collectively referred to herein as validation guidance.

2.0 QUALITY CONTROL REQUIREMENTS

The field and laboratory QC requirements for the characterization and remediation activities are discussed in the following subsections. Specific QC checks and acceptance criteria are provided in the referenced analytical methods.

2.1 Field Sampling Quality Control

The field QC requirements include analyzing reference standards for field instrument calibration and for routine calibration verifications. All initial and continuing calibration procedures will be implemented by trained personnel following the manufacturer's instructions to ensure the equipment is functioning within the specified tolerances. The calibration and maintenance history of the project-specific field instrumentation will be maintained in an active field logbook.

Field QC samples for this project include field duplicate samples to assess the overall precision of the sampling and analysis event, equipment rinse blanks to ensure proper cleaning of non-dedicated equipment is conducted between samples to avoid potential cross contamination (also generally referred to as field blanks), and trip blank samples to monitor cross contamination of water samples by volatile organic compounds (VOCs) during sample transport.

The frequency of collection of equipment rinse blanks will be one per sampling event. Field duplicate samples will only be prepared for groundwater samples, not for soil sampling events, at a collection frequency of 1 in 20 samples. One trip blank will be included for every shipment of samples to an analytical laboratory, at a minimum frequency of one trip blank per sample shipment which contains samples for VOCs analyses.

2.2 Analytical Quality Control

The laboratory QC requirements for the analyses may include evaluating chemical/thermal preservation, holding times, handling requirements, method blanks, instrument performance checks, initial calibration standards, calibration verification standards, internal standards, surrogate compound spikes, interference check samples, serial dilution samples, matrix spike/matrix spike duplicate (MS/MSD) samples, and laboratory control samples (LCS). The

acceptance criteria for the above identified requirements will be generated by the laboratory and included in the laboratory reports, along with the other laboratory QC requirements.

3.0 DATA VERIFICATION, VALIDATION, AND USABILITY

All field and laboratory data will be reviewed, verified, and/or validated. These terms are defined as follows:

- Data review is the in-house examination to ensure that the data have been recorded, transmitted, and processed correctly.
- Data verification is the process for evaluating the completeness, correctness, and conformance/compliance of a specific data set against the method, procedural, and/or contractual requirements.
- Data validation is an analyte-specific and sample-specific process that extends the evaluation of data beyond method, procedure, or contractual compliance (i.e., data verification) to determine the quality of a specific data set relative to the end use.

Field data and logbooks will be reviewed to ensure that the requirements of the sampling program, including the number of samples and locations, sampling, and sample handling procedures, were fulfilled.

Data verification, validation, and usability assessments performed on a percentage of lab packages to ensure that the data are scientifically defensible, properly documented, of known quality, and meet the project objectives, are described in the following sections. Data determined to be unusable may require corrective action be taken. Data use limitations will be identified in the data validation and usability assessment (VUA) report, which will be generated as required for characterization or final reporting to the agencies.

3.1 Data Review, Verification, and Validation Requirements

Data review, verification, and validation of the analytical data will be performed by each consultant completing the field activities. The exception to this scenario will be Aquaterra Technologies, Inc. (Aquaterra), in which case Aquaterra will review/verify the data and the consultant company working with Aquaterra will subsequently validate the samples.

Field information will be reviewed to ensure that all field measurements were conducted in accordance with the requirements of the site-specific work plan and this QA/QC Plan including applicable SOPs. Field measurements obtained using procedures inconsistent with the

requirements of these documents will be evaluated and may require that additional samples are collected or the use of the data be restricted.

Stage 1 Verification and Validation Checks

One hundred percent of the sample results will go through a Stage 1 verification and validation. As part of the data management process, each consultant will complete verification and validation based on the validation guidance. Data verification and validation will consist of the following items based on the guidance stated.

Stage 1 verification and validation of the laboratory analytical data package consists of checks for the compliance of sample receipt conditions, sample characteristics (e.g., percent moisture), and analytical results (with associated information). It is recommended that the following minimum baseline checks (as relevant) be performed on the laboratory analytical data package received for a Stage 1 validation label:

1. Documentation identifies the laboratory receiving and conducting analyses, and includes documentation for all samples submitted by the project or requester for analyses.
2. Requested analytical methods were performed and the analysis dates are present.
3. Requested target analyte results are reported along with the original laboratory data qualifiers and data qualifier definitions for each reported result.
4. Requested target analyte result units are reported.
5. Requested reporting limits for all samples are present and results at and below the requested (required) reporting limits are clearly identified (including sample detection limits if required).
6. Sampling dates (including times if needed), date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH and temperature) are documented.
7. Sample results are evaluated by comparing sample conditions upon receipt at the laboratory (e.g., preservation checks) and sample characteristics (e.g., percent moisture) to the validation guidance.

Stage 2 Verification and Validation Checks

A minimum of 10 percent of the samples will be flagged for VUA. When a laboratory work order is selected, the entire work order will undergo Stage 2 validation. Laboratory work orders or sample delivery groups (SDGs) that are selected for VUA will undergo validation based on the NFGs.

The selection of samples that will undergo VUA process is designed to meet the needs of the site investigation, characterization, remediation, and closure programs, such as tank closures. Sampling that falls outside these programs will not undergo the VUA process. This includes samples that are collected for permit compliance, such as RCRA and effluent wastewater, as well as product samples, onsite soil reuse samples, and waste characterization samples.

Ten percent of samples will be selected based on the following additional conditions:

1. Sample package selected will contain a field duplicate sample.
2. Sample package selected will contain an equipment rinse blank.
3. Sample package selected will be representative of the contracted analytical laboratories, sample media, parameters, time, and project goals.

QC samples that are collected in the field will provide the best information for completing the VUA reports. The conditions for selection of samples are designed to provide the most useful information regarding sample analysis. Therefore, field duplicate samples have been identified as a priority condition. However, field duplicate samples will only be prepared for groundwater samples, not for soil sampling events. This is due to the known, inherent heterogeneity of soil at the sites. For program efficiency, entire SDGs will be selected for submission in the VUA process. Individual samples should not be selected and processed unless there is an overriding reason to do so, such as a point of compliance sample result that when compared to the historic data set appears to be anomalous.

Stage 2 data validation includes a review of the following QC data deliverables:

1. Technical holding times
2. Method blanks
3. Surrogate spikes
4. MS/MSD results
5. LCS results
6. Field duplicates

7. Trip and equipment rinse blank samples

Stage 2B Verification and Validation Checks

Stage 2B verification and validation will be completed on inorganic analytical data and will contain the following (in addition to Stage 1 verification):

1. Requested methods (handling, preparation, cleanup, and analytical) are performed.
2. Method dates (including dates, times and duration of analysis for radiation counting measurements and other methods, if needed) for handling (e.g., Toxicity Characteristic Leaching Procedure), preparation, cleanup and analysis are present, as appropriate.
3. Sample-related QC data and QC acceptance criteria (e.g., method blanks, surrogate recoveries, deuterated monitoring compounds (DMC) recoveries, laboratory control sample (LCS) recoveries, duplicate analyses, matrix spike and matrix spike duplicate recoveries, serial dilutions, post digestion spikes, standard reference materials) are provided and linked to the reported field samples (including the field quality control samples such as trip and equipment blanks).
4. Requested spike analytes or compounds (e.g., surrogate, DMCs, LCS spikes, post digestion spikes) have been added, as appropriate.
5. Sample holding times (from sampling date to preparation and preparation to analysis) are evaluated.
6. Frequency of QC samples is checked for appropriateness (e.g., one LCS per twenty samples in a preparation batch).
7. Sample results are evaluated by comparing holding times and sample-related QC data to the requirements in the data validation guidance.
8. Initial calibration data (e.g., initial calibration standards, initial calibration verification [ICV] standards, initial calibration blanks [ICBs]) are provided for all requested analytes and linked to field samples reported. For each initial calibration, the calibration type used is present along with the initial calibration equation used including any weighting factor(s) applied and the associated correlation coefficients, as appropriate. Recalculations of the standard concentrations using the initial calibration curve are present, along with their associated percent recoveries, as appropriate (e.g., if required by the project, method, or contract). For the ICV standard, the associated percent recovery (or percent difference, as appropriate) is present.
9. Appropriate number and concentration of initial calibration standards are present.

10. Continuing calibration data (e.g., continuing calibration verification [CCV] standards and continuing calibration blanks [CCBs]) are provided for all requested analytes and linked to field samples reported, as appropriate. For the CCV standard(s), the associated percent recoveries (or percent differences, as appropriate) are present.
11. Reported samples are bracketed by CCV standards and CCBs standards as appropriate.
12. Method specific instrument performance checks are present as appropriate (e.g., tunes for mass spectrometry methods, DDT/Endrin breakdown checks for pesticides and aroclors, instrument blanks and interference checks for ICP methods).
13. Frequency of instrument QC samples is checked for appropriateness (e.g., gas chromatography-mass spectroscopy [GC-MS] tunes have been run every 12 hours).
14. Sample results are evaluated by comparing instrument-related QC data to the requirements in the data validation guidance.

Stage 3 Verification and Validation Checks

Stage 3 verification and validation will be completed on organic analytical data and will contain the following (in addition to Stage 2B):

1. Instrument response data (e.g., GC peak areas, ICP corrected intensities) are reported for requested analytes, surrogates, internal standards, and DMCs for all requested field samples, matrix spikes, matrix spike duplicates, LCS, and method blanks as well as calibration data and instrument QC checks (e.g., tunes, DDT/Endrin breakdowns, interelement correction factors, and Florisil cartridge checks).
2. Reported target analyte instrument responses are associated with appropriate internal standard analyte(s) for each (or selected) analyte(s) (for methods using internal standard for calibration).
3. Fit and appropriateness of the initial calibration curve used or required (e.g., mean calibration factor, regression analysis [linear or non-linear, with or without weighting factors, with or without forcing]) is checked with recalculation of the initial calibration curve for each (or selected) analyte(s) from the instrument response.
4. Comparison of instrument response to the minimum response requirements for each (or selected) analyte(s).
5. Recalculation of each (or selected) opening and closing CCV (and CCB) response from the peak data reported for each (or selected) analyte(s) from the instrument response, as appropriate.

6. Compliance check of recalculated opening and/or closing CCV (and CCB) response to recalculated initial calibration response for each (or selected) analyte(s).
7. Recalculation of percent ratios for each (or selected) tune from the instrument response, as appropriate.
8. Compliance check of recalculated percent ratio for each (or selected) tune from the instrument response.
9. Recalculation of each (or selected) instrument performance check (e.g., DDT/Endrin breakdown for pesticide analysis, instrument blanks, interference checks) from the instrument response.
10. Recalculation and compliance check of retention time windows (for chromatographic methods) for each (or selected) analyte(s) from the laboratory reported retention times.
11. Recalculation of reported results for each reported (or selected) target analyte(s) from the instrument response.
12. Recalculation of each (or selected) reported spike recovery (surrogate recoveries, DMC recoveries, LCS recoveries, duplicate analyses, matrix spike and matrix spike duplicate recoveries, serial dilutions, post digestion spikes, standard reference materials etc.) from the instrument response.
13. Each (or selected) sample result(s) and spike recovery(ies) are evaluated by comparing the recalculated numbers to the laboratory reported numbers according to the requirements in the data validation guidance.

Stage 4 Verification and Validation Checks

Additional data validation may be completed for selected sites and/or sampling events, up to EPA Level 4 data review, which will require a laboratory data package inclusive of raw data. Stage 4 verification and validation includes all of the elements of the previous stages of validation and the following:

1. Evaluation of instrument performance checks (GC/MS)
2. Initial and continuing calibration checks (organic and inorganic analyses)
3. Review of internal standards (GC/MS)
4. Instrument blanks (inorganics)
5. Interference check samples (metals)
6. Recalculations of sample results and reporting limits

3.2 Validation Codes

Consultant specific validation codes will be added to the database. This will allow quick identification of the consultant that has performed the verification and/or VUA. Stantec may append additional codes for data management purposes to the codes provided in dt_result table approval_code field. Valid codes are as follows:

Langan:

- LAN1 – Historical data collected by Langan Level 1 Validation (Verification)
- LAN-VER – Langan performed verification
- LAN-USB – Langan performed usability

GHD:

- GHD-VER – GHD performed verification
- GHD-USB – GHD performed usability

Stantec:

- STN-VER – Stantec performed verification
- STN-USB – Stantec performed usability

This methodology creates a means for consultants to perform verification and usability on data collected by another consultant.

3.3 Data Updates in the Electronic Data Deliverables

All consultants will request EQuIS 4 file format Electronic Data Deliverables (EDDs) for data management from the analytical laboratories. In order to facilitate the data updates in the database, the following methodology will be used.

1. The consultant chemist / chemist team will open the .RES file for the EDD that has been selected to be validated for usability. The file can be opened using Excel, Access, Notepad, or similar tool. Although, it is a best practice to open the file in a way to preserve the textual nature of the EDD, it is not necessary.
2. The chemist will use the result_comment field in the .RES file to enter the qualifiers associated with the record and add a semicolon as a delimiter (;) followed by the reason code for the qualification.

3. The .RES file is to be saved with a .USB extension at the end of the file. This file is to be separate from the original .RES file provided and should not be used to over write the original .RES file that was sent with the EDD. This will result in the laboratory work order undergoing VUA having five files instead of four for the EDD. For example:
    - 1234.SMP
    - 1234.TST
    - 1234.BCH
    - 1234.RES
    - 1234.RES.USB
4. Stantec will use the fifth file to update the database with the appropriate qualifiers and codes in validator_qualifiers and approval_a through approval_d fields in dt_result table in the database.
5. Stantec will also change the validated y/n field in dt_result table in the database for the particular EDD.

3.4 Validation Qualifiers

The following qualifiers should be used during the validation/usability process. These are based on the NFGs, validation guidance, and commonly used qualifiers.

Data Qualifiers and Definitions

U The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J+ The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample, potentially biased high.

J- The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample, potentially biased low.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

NJ The analyte has been "tentatively identified" or "presumptively identified" as present and the associated numerical value is the estimated concentration in the sample.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

B The analyte was detected in the method, field, and/or trip blank. This qualifier is not pursuant to the NFGs.

If additional qualifiers are required, please forward the suggestions to the Stantec Data Management Team and they will be added to the list of approved codes.

Submitting Data and Validation Codes for Inclusion in the Database

EDDs will be submitted to the database using the SharePoint portal intake forms. The appropriate qualifiers and codes that have been added to the result_comment field in the .RES.USB file will be included in the submission.

Reason Codes

Following is a list of reason codes available for validation. If additional codes are required, please forward the suggestions to the Stantec Data Management Team and they will be added to the list of approved codes.

Reason Code	Reason Description
General Use	
EC	Result exceeds the calibration range.
HT	Holding time requirement was not met
MB	Method blank or preparation blank contamination
LCS	Laboratory control sample evaluation criteria not met
FB	Field blank contamination
RB	Rinsate blank contamination
SQL	The analysis meets all qualitative identification criteria, but the measured concentration is less than the reporting limit.
FD	Field duplicate evaluation criteria not met
TvP	Total to Partial criteria not met
RL	Reporting limit exceeds decision criteria (for non-detects)
Inorganic Methods	
ICV	Initial calibration verification evaluation criteria not met
CCV	Continuing calibration verification evaluation criteria not met
CCB	Continuing calibration blank contamination
PB	Preparation Blank
ICS	Interference check sample evaluation criteria not met
D	Laboratory duplicate or spike duplicate precision evaluation criteria not met
MS	Matrix spike recovery outside acceptance range
PDS	Post-digestion spike recovery outside acceptance range
MSA	Method of standard additions correction coefficient _0.995
DL	Serial dilution results did not meet evaluation criteria
Organic Methods	
TUNE	Instrument performance (tuning) criteria not met
ICAL	Initial calibration evaluation criteria not met
CCAL	Continuing calibration evaluation criteria not met
SUR	Surrogate recovery outside acceptance range
MS/SD	Matrix spike/matrix spike duplicate precision criteria not met
MS	Matrix spike recovery outside acceptance range
IS	Internal standard evaluation criteria not met
LM	The PFK lock mass SICPs indicate that ion suppression evident
ID	Target compound identification criteria not met
Results Reported for Analytes Analyzed Multiple Times	
NSR	Not selected for reporting because the result was qualified as unusable
NSDL	Not selected for reporting because diluted resulted was selected for reporting
NSQ	Not selected for reporting because result was lesser quality based on data validation
NSO	Not selected for reporting because of other reason
Bias Codes	
H	Bias in sample result likely to be high
L	Bias in sample result likely to be low
I	Bias in sample result is indeterminate

3.4 Verification and Validation Summary

Verification of sample collection procedures will consist of reviewing sample collection documentation for compliance with the requirements of the site-specific work plan and this QA/QC Plan. If alternate sampling procedures were used, the acceptability of the procedure will be evaluated to determine the effect on the usability of the data. Data usability will not be affected if the procedure used is determined to be an acceptable alternative that fulfills the measurement performance criteria in this QA/QC Plan.

The results of the data verification and validation procedure will identify data that do not meet the measurement performance criteria of this QA/QC Plan. Data verification and validation will determine whether the data are acceptable, of limited usability (qualified as estimated), or rejected. Data qualified as estimated will be reviewed and a discussion of the usability of estimated data will be included in the VUA report.

Data determined to be unusable may require corrective action to be taken. Potential types of corrective action may include resampling by the field team or reanalysis of samples by the laboratory. The corrective actions taken are dependent upon the ability to mobilize the field team and whether or not the data are critical for project data quality objectives to be achieved. Data use limitations will be identified in VUA report, which will be generated as required for characterization or final reporting to the agencies. Each consultant will be responsible for their own VUA reports.

Revision History

Revision	Description	Prepared By	Date
1.0	Initial creation of document as SOP for VUA	Stantec (Gus Sukkurwala/Jennifer Menges/Andrew Bradley)	5/31/2015
2.0	Incorporation into QA/QC Plan	GHD (Colleen Costello)	3/21/2016
3.0	Inclusion of Field Procedures. Edits from Langan (Emily Strake & Kevin McKeever)	Stantec (Jennifer Menges)	5/13/2016

1.0 INTRODUCTION

This Field Procedures Manual outlines the standard operating procedures developed to ensure the collection and analysis of quality data for investigations completed under the United States Environmental Protection Agency (USEPA) Resource Conservation and Recovery Act (RCRA) program, Pennsylvania Department of Environmental Protection (PADEP) Act 2 program and Pennsylvania and Delaware's Tank programs at the Sunoco Partners Marketing and Terminals, LP (Sunoco Partners) Marcus Hook Industrial Complex (MHIC) and the Philadelphia Energy Solutions Refining and Marketing, LLC (PES) Philadelphia Refinery Complex (PRC) on behalf of Evergreen Resources Management Operations (Evergreen). The MHIC and PRC are herein referred to as facility or site.

Evergreen's consultants collect data in pursuit of site characterization and remediation that will meet the expectations of the appropriate regulatory agencies. This document shall be used in conjunction with the site-specific work plans developed for each site and the QA/QC Plan of which this manual was incorporated as Appendix A.

1.1 Training Qualifications

All field personnel involved in field work at MHIC and the PRC shall have completed and where applicable, be current with OSHA 40-hour HAZWOPER training, annual OSHA 8-hour HAZWOPER refresher, Process Safety Management (PSM) training, site-specific safety module training for current facility badges (including fire watch and hole watch, if required), TWIC Card, annual drug screening, and annual respirator fit testing. All field personnel new to the facility should be provided with onsite health and safety (H&S) orientation by an experienced member of the project team. The onsite orientation should include review of the facility's emergency action plan and training on Evergreen and site-specific H&S requirements. Appropriately qualified personnel should perform field work, based on the work scope and experience level required by the task to be executed.

1.2 Health and Safety Requirements

All consultants performing work at the referenced sites on behalf of Evergreen shall comply with the *Evergreen Resources Management Operations Health and Safety Requirements* dated June 1, 2014. This includes contractors, sub-contractors, and third party companies performing

work for Evergreen at MHIC and the PES PRC. Each consultant must also have their own site-specific health and safety plan (HASP) submitted to and approved by Evergreen prior to performing any work. A site-specific HASP must be reviewed and signed by all field personnel prior to commencement of field activities.

1.3 PPE Requirements

The minimum standard PPE at the facilities includes fire resistant clothing (FRC; coveralls may be Nomex or other FRC, 6 ounce minimum, orange in color) with the name of the company displayed on the back of the garment, hard hat, sturdy safety-toe boots, safety glasses, long-gauntlet leather gloves, and personal H_2S monitors. Nitrile gloves for chemical protection and hearing protection may also be required depending on the location and type of work. Workers are to be trained on these PPE requirements before being permitted onsite. An appropriate respirator may be required if site-specific air monitoring action levels are met, in accordance with the site-specific HASP. If a worker has a particular sensitivity or concern, a respirator may be worn regardless of OSHA action levels. During winter weather conditions, slip prevention footwear such as crampons or overshoes should be worn for traction. Task-specific PPE will be further identified in following sections.

1.4 Site Controls

Safety cones and/or caution tape should be used in high traffic areas. The "Buddy System" may also be employed in high traffic areas, in areas where other contractors are working, and in remote areas. Additional task-specific site controls will be detailed in following sections.

1.5 Equipment and Decontamination

Numerous practices are employed throughout the processes of site investigation and sampling to assure the integrity of the resulting data. The risk in use of non-dedicated equipment at multiple sampling locations lies in the potential for cross-contamination. While the threat of cross-contamination is always present, it can be minimized through the implementation of a consistent decontamination program during sensitive site measurement and data collection activities.

All site equipment to be used in multiple locations (non-dedicated) for sampling of soil, sediment, and/or groundwater will be decontaminated immediately prior to initial use and between uses at each location according to the following steps:

- Remove particulates with a sorbent pad or towel and/or initial rinse with clean potable tap water;
- Wash equipment with clean sponge, soft cloth, or scrub brush as necessary in a solution of tap water/laboratory grade detergent (Alconox®, Liquinox®, or equivalent);
- Rinse with tap water;
- Rinse with deionized or distilled water; and
- Air dry for as long as possible.

Rinse water generated during decontamination procedures will be treated onsite by passing the water through a bucket or tube filled with activated carbon prior to discharge to the ground surface. Additional decontamination procedures may be appropriate depending on the task, and will be identified in the following sections, as applicable.

1.6 Documentation

All site activities and conditions for characterization activities should be recorded by field personnel in a field computer (e.g., YUMA) using the EQuIS Data Gathering Engine (EDGE) application, or if necessary, a field book may be used. The entry shall include at a minimum, the date, time, weather conditions, location, personnel present onsite, field readings, sampling methodology, as well as additional comments or observations. Task specific observations which should also be recorded will be identified in the following applicable sections.

2.0 LIQUID LEVEL ACQUISITION (WELL GAUGING) PROCEDURES

2.1 Potential Hazards

Traffic, pinch points, chemical (airborne and physical contact), and biological are all likely hazards to be encountered as well as slip/trip/fall potential during onsite well gauging activities. Additional hazards may be mentioned in the site-specific HASP and/or the daily job safety analysis (JSA).

2.2 Materials and Equipment Necessary for Task Completion

Optical oil/water interface probe with a graduated measuring tape to 0.01 foot accuracy, decontamination supplies (laboratory-grade detergent, deionized or distilled water, appropriate containers, scrub brush, and sorbent pads or paper towels), socket set, flathead screwdriver (or pry bar or manhole cover lifter), clear bailers with string for confirmation of light non-aqueous phase liquids (LNAPL), if necessary, and air monitoring instruments (optional, based on previous site visits).

2.3 Methodology

This task involves the deployment of an optical oil/water interface probe with a graduated measuring tape to 0.01 foot accuracy into a well (in most cases), recording the measurement, and decontaminating the probe. The recorded field measurements may then be utilized for one of several applications including: well sampling, water table gradient mapping, LNAPL occurrence, LNAPL thickness, and/or gradient mapping, and various testing procedures. Wells should be gauged in order of least to most contaminated, based on existing sampling data or LNAPL occurrence, to minimize the potential for cross-contamination between wells. If LNAPL is detected in a well that does not typically have LNAPL, it should be confirmed with a clear bailer.

The proper procedure for liquid level acquisition is as follows:

1) Decontaminate the optical oil/water interface probe with a graduated measuring tape to 0.01 foot accuracy prior to initial deployment, and again after each well measurement to prevent cross-contamination between wells.

2) If warranted, mark off a work area surrounding the well(s) to be gauged with safety cones and/or caution tape in order to protect personnel from auto traffic; the "Buddy System" may also be employed.

3) Where applicable, lift the manhole cover off of the well head (a screwdriver, pry bar, or manhole cover lifter may be used to lift the cover depending on the size of the manhole) or open protective well casing (stickup) and remove the well plug, if present.

4) Most wells should contain a mark or notch in the top edge of the casing from which normalized readings are to be measured (reference point elevation). Slowly lower the optical oil/water interface probe with a graduated measuring tape to 0.01 foot accuracy into the well until the instrument signals contact with liquid. Note whether or not the instrument's tone is indicative of the presence of free-phase LNAPL (commonly a solid tone), or water (commonly an oscillating or beeping tone). If LNAPL is present, record the depth at which LNAPL was first indicated to the nearest hundredth of a foot, as measured from the top of well casing mark/notch. Slowly lower the probe through the LNAPL until the instrument's tone changes to indicate the presence of water. Record the depth at which water was first indicated to the nearest hundredth of a foot. A clear bailer may be used to verify the existence or approximate amount and appearance of LNAPL. If no LNAPL is apparent, record the depth to water.

5) Retract the probe from the well and secure the well appropriately.

6) Note the date and time of measurement for gauging and record all measurements and observations in the field computer or, if necessary, in a field book for subsequent electronic data entry.

7) Decontaminate the probe in accordance with the decontamination procedure outlined in Section 1.5.

8) Clean up the work area, remove gauging equipment, and remove any traffic control devices.

3.0 GROUNDWATER MONITORING PROCEDURES

3.1 Potential Hazards

Traffic, pinch points, chemical (airborne and physical contact), and biological are all likely hazards to be encountered as well as slip/trip/fall potential during onsite well gauging activities. Additional hazards may be mentioned in the site-specific HASP and/or the daily JSA.

3.2 Materials and Equipment Necessary for Task Completion

A list of equipment required to access, gauge, purge, and sample site monitoring wells is presented below. Also listed are materials necessary to store, label, preserve, and transport groundwater samples.

- Current site map detailing well locations;
- Field book and/or field computer for recording site data;
- Graduated, optical oil/water interface probe;
- Keys and tools to provide well access;
- Appropriate, laboratory prepared sample containers and labels;
- Appropriate well purging apparatus as determined by volume of groundwater to be purged and compounds to be analyzed;
- Water quality meter for monitoring indicator field parameters (DO, pH, specific conductance, redox potential, and turbidity if available);
- Dedicated polyethylene bottom-loading bailer or well pump and disposable tubing for groundwater sample collection;
- Clean nylon or polypropylene bailer cord;
- Disposable nitrile sampling gloves;
- Decontamination supplies;
- Calibrated five-gallon bucket and watch or stopwatch to determine discharge rate during purging;
- Blank chain-of-custody forms; and

- Cooler(s) and ice for sample preservation.

3.3 Methodology for Three Well Volume Sampling

Prior to site visitation for the groundwater sampling event, the following data will be reviewed to ensure proper preparation for field activities:

- Most recent liquid level data from all wells;
- Most recent analytical data from all wells to determine gauging and sampling sequence; and
- Well construction characteristics.

Each monitoring well to be sampled will be gauged to obtain liquid level data immediately prior to initiation of the sampling process (refer to well gauging procedures above). Liquid level data should be recorded in a field computer or if necessary, a field book. Should free-phase LNAPL be detected by the gauging process, routine groundwater sampling will not be conducted at that location. If groundwater sampling under LNAPL is warranted, refer to the sub-LNAPL sampling section and methodology in Section 3.6.

Groundwater sampling will be initiated by purging from the well a minimum of three well volumes, except in cases where the well is pumped dry, as referenced below. Well purging is performed to remove stagnant water and to draw representative water from the aquifer into the well for subsequent sampling and analysis. In extreme cases where a well is pumped dry and/or shows little recharge capacity, the well should be evacuated once prior to sampling. Wellbore storage volume should be estimated using as-built information stored in the field computer or as indicated on the well log, and the depth to water measurement obtained immediately prior to sampling.

Water quality should be monitored and readings recorded in the field computer or field book while purging, typically through use of a multi-parameter water quality meter with a flow through cell or cord for down-well measurements. Water quality readings should be recorded a minimum of three times (pre-purge, during purge, and post-purge/sample collection) or four times (pre-purge and following each well volume). The parameters to be monitored and recorded are

dissolved oxygen, pH, specific conductance, redox potential, temperature, and turbidity if available.

Well purging can be performed with various equipment including: a dedicated bailer for hand bailing low volumes of water; a surface mounted electric centrifugal pump with dedicated polyethylene tubing; and/or submersible pump (particularly when the depth to water is greater than 20 feet) with dedicated polyethylene tubing. During pumping, the intake will be placed directly below the static water surface and slowly lowered during the purging process. This procedure may not be necessary in low-yielding wells but is important in high-yielding, permeable strata where an intake initially placed deep in a well may draw laterally and have little influence in exchanging water from shallower depths within the well bore.

Flow rate during well purging will be approximated by the bucket and stop watch method. The duration of pumping required to remove three well volumes will be calculated directly from this flow rate. All fluids removed during purging will be treated onsite with activated carbon or in accordance with an approved work plan.

The sequence of obtaining groundwater samples will be based upon available historical site data for existing wells and photoionization detector (PID) readings for newly installed wells. Monitoring wells will be sampled in order of those having the lowest to highest concentration of constituents of concern (or PID readings for new wells), based upon the most recent available set of laboratory analyses, to reduce the potential for cross-contamination. For general monitoring events, groundwater samples will not be obtained for analysis from any well containing measurable free product. If groundwater sampling under LNAPL is warranted, refer to the sub-LNAPL sampling section and methodology in Section 3.6.

The following sequence of procedures will be implemented for the collection of groundwater samples from monitoring wells.

1) Establish a clean work area where sampling equipment will not come in contact with the ground or any potentially contaminated surfaces.
2) Use a dedicated polyethylene sampling bailer for each well.
3) Use a clean pair of nitrile gloves.

4) Attach an appropriate length of unused, clean nylon or polypropylene cord to the designated sampling bailer.

5) Select appropriate laboratory-provided sample containers.

6) Slowly lower sampling bailer into well until water surface is encountered; continue to lower the sampling bailer into the standing water column to one foot below the water surface.

7) Retrieve bailer at a steady rate to avoid excess agitation.

8) Visually inspect bailed sample to ensure that no free product or organic detritus has been collected.

9) Uncap first designated sample vial and fill from bailer as rapidly as possible but minimizing agitation; secure septum and lid.

10) Inspect sealed sample for entrapped air; if air is present, remove the lid and gently top off sample in vial, seal and inspect. Repeat until no air is apparent.

11) Repeat Steps 9 and 10 for the remaining sample vials based on the laboratory and/or regulatory protocol.

12) Complete and attach labels to sample containers noting sample collector, date, time, and location of sample; record same data in field computer or field book.

13) Place samples in ice-filled cooler in such a manner as to avoid breakage. Samples will be maintained at a temperature of approximately 4°C.

14) Dispose of gloves, bailer, and bailer cord as solid waste and move to next sample location.

3.4 Methodology for Low-Flow Purging and Sampling

For wells that will be purged and sampled via low-flow methodology, the USEPA Region III Bulletin QAD023: *Procedure for Low-Flow Purging and Sampling of Groundwater Monitoring Wells* will be followed. The following data will be reviewed for each well in order to set the pump intake for the low-flow sampling:

- Soil boring lithologic log;
- Well construction log showing the screened interval;
- Identification of the most permeable zone screened by the well;
- Approximate depth to static water;

- Proposed pump intake setting; and
- Technical rationale for the pump intake setting, preferably across from the most impacted/contaminated subsurface interval.

Adjustable rate, submersible, bladder pumps in conjunction with polyethylene tubing for purging and sampling will be used. An alternate set up could include a stainless steel submersible pump, such as a Hurricane® pump or a Monsoon® pump with dedicated polyethylene tubing. The tubing diameter will be between 3/16-inch and ½-inch inner diameter and the length of the tubing extended outside of the well should be minimized. Flow-through cells will be used to monitor groundwater quality parameters during sampling. Monitoring well information, equipment specifications, water level measurements, parameter readings, and other pertinent information will be recorded during well purging and sampling.

The following sequence of procedures will be implemented for the collection of groundwater samples from monitoring wells by the low-flow methodology.

1) PID Screening of Well: A PID measurement may be collected at the rim of the well immediately after the well cap is removed and recorded in the field computer or field book, if historic data is not available.
2) Depth to Water Measurement: A depth to water measurement will be collected and recorded. To avoid disturbing accumulated sediment and to prevent the inadvertent mixing of stagnant water, measuring the total depth of the well should be done at the completion of sampling.
3) Low Stress Purging Startup: Water pumping will commence at a rate of 100 to 400 milliliters per minute (mL/min). This pumping should cause very little drawdown in the well (less than 0.2-0.3 feet) and the water level should stabilize. Water level measurements are made frequently, and flow rate will be recorded in mL/min on the sampling form or field computer.
4) Low Stress Purging and Sampling: The water level and pumping rate will be monitored and recorded every five minutes during purging, and any pumping rate adjustments will be recorded. During the early phase of purging, emphasis will be placed on minimizing and stabilizing pumping stress, and recording any necessary adjustments. Adjustments, when necessary, will be made in the first 15 minutes of purging. If necessary, pumping rates will

be reduced to the minimum capabilities of the pump to avoid well dewatering. If the minimal drawdown exceeds 0.3 feet, but the water level stabilizes above the pump intake setting, purging will continue until indicator field parameters stabilize, as detailed in Step 5 below. If the water level drops below the pump intake setting at the absolute minimum purge rate, the pump will remain in place and the water level will be allowed to recover repeatedly until there will be sufficient water volume in the well to permit the collection of samples.

5) Indicator Field Parameter Monitoring: During well purging, indicator field parameters (DO, pH, specific conductance, redox potential, and turbidity if available) will be monitored every five minutes (or less frequently, if appropriate). Purging will be considered complete and sampling can commence when all the indicator field parameters have stabilized. Stabilization will be achieved when three consecutive readings, taken at five minute intervals (or less frequently, if appropriate), are within the following limits:
    - DO (±10 percent);
    - turbidity (±10 percent);
    - specific conductance (±3 percent);
    - pH (± 0.1 unit); and
    - redox potential ([Eh] ±10 mv).

    Temperature and depth to water will be also monitored during purging. Should any of the parameter-specific components of the water quality meter fail during monitoring, the sampling team will attempt to locate a replacement multi-meter or individual criteria meter. If none are available, the sampling team will continue recording the parameters that are operational, and proceed with the sampling. Any other field observations relating to sample quality, such as odor, foaming, effervescence, and sheens, will also be recorded in the field computer or on the sampling form.
6) Collection of Ground Water Samples: Water samples for laboratory analyses will be collected prior to the flow-through cell by either using a bypass assembly or by temporarily disconnecting the flow-through cell. All sample containers will be filled by allowing the pump discharge to flow gently down the inside of the container with minimal turbulence. During purging and sampling, the tubing should remain filled with water in order to minimize possible changes in water chemistry upon contact with the atmosphere. Methods employed to ensure that the outlet tubing will be filled include adjusting the tubing angle upward to

completely fill the tubing and restricting the diameter of the tubing near the outlet of the tubing.

The order in which samples will be collected is as follows:

- Volatile organics;
- Gas sensitive (e.g., Fe^{+2}, CH_4, H_2S/HS);
- Base neutrals or PAHs;
- Total petroleum hydrocarbons;
- Total metals;
- Dissolved metals;
- Cyanide;
- Sulfate and chloride;
- Nitrate and ammonia;
- Preserved inorganic;
- Non-preserved inorganic; and
- Bacteria.

After the appropriate laboratory-provided glassware is filled and labeled, the samples shall be placed in an ice-filled cooler and maintained at approximate 4°C for submittal to the laboratory. Upon completion of sampling at the well, decontaminate non-dedicated equipment in accordance with the decontamination procedure outlined in Section 1.5, and dispose of all dedicated equipment (gloves, tubing, etc.) as solid waste before moving to the next location.

3.5 Methodology for Passive (No-Purge) Sampling for Groundwater Collection

There are many passive groundwater sampling devices that allow for accurate sample collection without purging. Each device has specific uses and conditions for which they are more applicable. This methodology presents details for the use of HydraSleeve samplers.

The HydraSleeve is a disposable, single use device for the collection of representative groundwater samples for laboratory analysis of physical and chemical parameters.

HydraSleeves are placed within the screened interval (or other defined interval) of the well and activated after an equilibrium period. When used according to the manufacturer's instruction, the HydraSleeve will collect a groundwater sample without purging, thus causing no drawdown, agitation, or water column mixing. The HydraSleeve collects a sample from the screened interval only, and excludes water (or other fluids) from other parts of the well by use of check valve that seals when the sampler is full. The HydraSleeve takes advantage of the continuous natural movement of groundwater, which produces an equilibrium condition between the water in a well screen and the adjacent formation. HydraSleeves produce reliable data from low yield wells where other sample methods cannot due to well screen dewatering and associated alteration in water chemistry.

The HydraSleeve consists of the following components:

1) A long (usually 3 to 5 feet), flexible, lay-flat polyethylene sample sleeve, which is sealed at the bottom, and is equipped with a reed valve at the top allowing water to enter the HydraSleeve only during active sample retrieval.
2) A reusable, stainless steel weight attached with a clip to the bottom of the sleeve. The weight is used to carry the sample sleeve down the well to the specified depth (usually the bottom of the well screen). An optional top weight is also available to compress the sleeve in wells with short well screens.
3) A tether line attached to a spring clip at the top of the sample sleeve to deploy the device within the well and later retrieve it for sample collection.
4) A discharge tube is supplied with the device, which is used to puncture the wall of the sleeve after it is recovered to allow direct filling of sample bottles.

Deployment

Upon retrieval, the HydraSleeve is designed to effectively collect a "core" of water from within the well screen, which is equivalent in length and diameter to the sample sleeve. The upward motion opens the valve at the top, which then allows the device to fill with water. The Hydrasleeve should be installed with the top of the sample sleeve as close to the desired sample interval as possible. This will allow the sampler to fill and the check valve to close before the top of the device is pulled past the top of the sample interval.

To assemble and deploy the HydraSleeve:

1) Remove the Hydrasleeve from its package and hold it by the top, pinching the top at the holes.
2) Attach the spring clip and tether in the holes.
3) Slide the clip and bottom weight assembly into the holes at the bottom of the sleeve.
4) Lower the Hydrasleeve by the tether to the bottom or to the specified depth and secure the tether at the wellhead (Note: do not pull the HydraSleeve upward at any time during deployment, as this could cause the check valve to open and water to fill the sleeve inadvertently).

Sample Collection

Although the HydraSleeve only displaces approximately 100 milliliters (ml) of water during deployment, the well should be allowed to stabilize prior to sample collection so that natural flow conditions and contaminant distribution can return to equilibrium conditions. In certain jurisdictions, regulatory directives may prescribe a minimum equilibration period. When used for periodic monitoring programs, such as quarterly or semi-annual sampling, the HydraSleeve can be installed and remain in the well until the next sampling event, thus providing ample time for the well to equilibrate.

To collect a sample:

1) Be sure the tether is secured to the top of the well.
2) In one smooth motion, pull the tether upward at a rate of approximately 1 foot per second. The weight of the sampler will be felt when the valve closes. Continue pulling upward until the HydraSleeve is clear of the well.
3) Discard the water trapped at the top of the HydraSleeve above the reed valve.
4) Hold the HydraSleeve at the reed valve, and puncture the sleeve with the discharge tube just below the reed valve.
5) Decant the water into sample containers.
6) Discard the HydraSleeve as solid waste and process the excess water through activated carbon prior to discharge to the ground surface.

The weight and clips should be decontaminated prior to deploying a replacement HydraSleeve in the well. Tethers can be dedicated to individual wells or decontaminated and reused.

3.6 Methodology for Sub-LNAPL Sampling

The following section describes the methodology used for obtaining groundwater samples from the water column beneath LNAPL. Wells for sub-LNAPL sampling are not purged of three well volumes prior to sampling. This will prevent the potential of drawing LNAPL into the sample and to be representative of steady-state groundwater conditions beneath the LNAPL.

The following data will be reviewed for each well in order determine the appropriate equipment necessary:

- Well construction log showing diameter and total depth of the well;
- Approximate depth to LNAPL; and
- Approximate depth to static water.

A list of equipment for sub-LNAPL sampling is presented below:

- Field book or field computer for recording site data;
- Optical oil/water interface probe with a graduated measuring tape to 0.01 foot accuracy;
- Keys and tools to provide well access;
- Peristaltic pump;
- Polyethylene tubing specifications of 0.25-inch outer diameter x 0.17-inch inner diameter is preferable as this small diameter assists in achieving lower flow rates;
- Silicone tubing of appropriate diameter to operate peristaltic pump;
- Polyvinyl chloride (PVC) drop tube (1.5-inch or other appropriate diameter);
- PVC rod (0.5-inch or other appropriate diameter);
- PVC end cap for drop tube;
- Tether for end cap;
- Clamps for securing drop tube to well casing;
- Appropriate sample containers and labels;

- Decontamination supplies;
- Blank chain-of-custody forms; and
- Cooler and ice for sample preservation.

The following sequence of procedures will be implemented for the collection of sub-LNAPL groundwater samples.

1) Determine LNAPL Thickness: Use an optical oil/water interface probe with a graduated measuring tape to 0.01 foot accuracy to collect depth to LNAPL and depth to water measurements.
2) Installing Sampling Equipment: Deploy a 1.5-inch (or other appropriate diameter) PVC pipe (drop tube), with an attached end cap, through the LNAPL layer in the well. The end cap should be tethered to the drop tube so it is not lost in the well when removed and in a way that allows the drop tube to be sealed during installation. Lower the drop tube until the bottom of the tube is approximately two feet into the water column below the bottom of the LNAPL. Secure the drop tube to the well, and allow the system to equilibrate, approximately one half hour. The end cap is then removed by inserting a 0.5-inch (or other appropriate diameter) PVC rod into the drop tube and pushing on the cap until the lid is removed. The cap will be removed along with the tube upon completion of sampling.
3) Collection of Groundwater Samples: Lower polyethylene tubing through the 1.5-inch drop tube into the water column. Connect the polyethylene tubing to silicon tubing and engage the peristaltic pump for groundwater retrieval. Set the flow rate to the lowest pumping rate that can be sustained so that the LNAPL is not drawn into the tubing. Begin collecting groundwater in the sample container and continue until enough volume is obtained for all bottleware required by the laboratory for the requested analyses.

3.7 Decontamination Requirements

Of particular significance to the procedures of groundwater measurement and sampling is the limitation, whenever possible, of materials inserted into a well bore and, even more importantly, of materials transferred from well to well.

Many items can be discarded between well sampling and/or gauging locations without significantly impacting project costs. Dedicated sampling equipment which can be discarded

between well sampling locations, will be used whenever possible to preclude decontamination requirements. Sampling equipment included in this category are polyethylene bailers, bailer cord, nitrile gloves, and sampling tubing. However, other monitoring and sampling equipment, such as oil/water interface probes and submersible sampling pumps, must be reused from well to well.

All site equipment to be used in multiple locations (non-dedicated) for gauging and/or sampling of groundwater will be decontaminated immediately prior to initial use and between uses at each location according to the following steps:

- Remove particulates with a sorbent pad or towel and/or initial rinse with clean potable tap water;
- Wash equipment with clean sponge, soft cloth, or scrub brush as necessary in a solution of tap water/laboratory grade detergent (Alconox®, Liquinox®, or equivalent);
- Rinse with tap water;
- Rinse with deionized or distilled water; and
- Air dry for as long as possible.

Rinse water generated during decontamination procedures will be treated onsite by passing the water through a bucket filled with activated carbon prior to disposal.

3.8 Documentation

All site activities and conditions at the time of purging and groundwater sampling should be recorded by field personnel in a field computer via the EDGE application or, if necessary, a field book may be used. The entry shall include the date, time, weather conditions, location (well name), personnel present onsite, PID readings, sampling methodology, purge rate, purge volume, and the aforementioned groundwater indicator parameters. A field qualifier “SL” shall be applied to each sub-LNAPL sample entry to denote sample collection as sub-LNAPL. Additional comments or observations (e.g., well damage, nearby pumping, LNAPL sheen) should also be recorded.

4.0 SOIL SAMPLING & WELL INSTALLATION PROCEDURES

4.1 Site Controls

Prior to hand augering, hydroexcavation, utilizing a backhoe, or deploying any drilling apparatus to the site, an underground utility line protection request must be made (i.e., Pennsylvania One Call) for mark-out of known subsurface utilities and associated laterals proximal to the drilling location. Site plans, if available, should be reviewed to document and avoid the location of onsite utilities.

After review of all known mapped and marked utilities, a site reconnaissance will be performed to document the location of utility meters and storm sewer drains. In addition, the location of overhead utilities must be documented. After completing the subsurface and overhead utility review, the area to drill may be considered clear of utilities, or the location may be adjusted to a nearby location, which must also be cleared.

Lastly, any drilling activities must be preceeded by clearing of the borehole, prior to advancement of augers or split spoons. To ensure the safety of workers, the borehole will be cleared by hand, hydroexcavator, or backhoe to a depth of approximately 8 feet below ground surface.

4.2 Potential Hazards

Traffic, pinch points, chemical (airborne and physical contact), and biological are all likely hazards to be encountered during soil sampling and well installation, as well as slip/trip/fall potential. Drilling is considered a high risk activity which requires facility approval prior to implementation. Additional hazards are identified in the site-specific HASP and/or the daily JSA.

4.3 Materials and Equipment Necessary for Task Completion

A list of equipment required to oversee test boring advancement and, where applicable, sample soil is presented below. Also listed are materials necessary to store, label, preserve, and transport soil samples.

- Current site map detailing well locations;
- Field computer and/or field book for recording site data;

- Appropriate, laboratory prepared sample containers and labels;
- PID;
- Single-use, disposable plastic scoops or stainless steel scoop for collecting soil samples;
- Single-use, disposable, laboratory-supplied syringes for soil sample collection (if applicable);
- Scale for weighing samples (e.g., methanol kits, if necessary);
- Disposable nitrile sampling gloves;
- Measuring tape (for measuring core recovery);
- Munsell soil color chart/book (recommended);
- Decontamination equipment (if applicable);
- Blank chain-of-custody forms; and
- Cooler(s) and ice for sample preservation.

4.4 Decontamination Requirements

All down-hole drilling equipment must be steam cleaned prior to drilling at each soil boring or well location. All soil sampling equipment must be cleaned with detergent and rinsed with deionized or distilled water prior to deployment into the borehole. All well construction materials (i.e. PVC well casing, PVC well screen, sand pack, bentonite) should be clean and dedicated to each borehole.

4.5 Methodology for Soil Boring Installation

4.5.1. Borehole Advancement

During test drilling activities, a borehole is advanced into the subsurface via a rotary or direct-push drilling technique. Various types of drilling methods could be deployed at these facilities to advance the borehole and gain access to the subsurface for characterization and sampling. A description of the most commonly utilized drilling methods is included below:

4.5.1.1 Hollow Stem Auger

A hollow, steel pipe (available diameters vary) with welded, exterior steel "flights" is used to convey subsurface material to the surface when rotated clockwise. A bit at the bottom of the lead auger cuts into the subsurface material, and the rotation conveys the loosened material (cuttings) up the flights, allowing the hole to be advanced (cuttings may not always return to the surface, such as when drilling in soft, saturated materials). The hollow center of the auger allows the driller to access the subsurface for soil sample collection and, where applicable, well installation during borehole advancement. During borehole advancement, a center stem of steel rods connected to an auger plug prevent soil cuttings from entering the drill column. Once a desired drilling depth is reached, the center plug and rods can be pulled out, leaving the auger stem in place to prevent borehole collapse. A split-spoon sampler can be threaded onto the rods in place of the plug and driven via a hammer to obtain a sample (Standard Penetration Test), or if terminal depth has been reached a monitoring well could be installed through the augers.

4.5.1.2 Air and Mud Rotary

Rotary drilling methods are similar to hollow stem auger drilling, however specialized drilling bits at the bottom of rods are used to cut into the subsurface material using compressed air, vibration, and/or pressurized drilling mud. Compressed air or mud is forced through the drilling rods via an air compressor or pump, and escapes through small holes in the drill bit. The circulation of drilling mud, or air combined with introduced water or formation water, conveys the soil cuttings to the surface (while also cooling the drilling bit and preventing borehole collapse).

4.5.1.3 Geoprobe®

A direct-push drilling method, Geoprobe® sampling utilizes a hydraulic hammer to drive steel rods into the subsurface for soil sampling. This method advances a core barrel lined with a plastic Macro-Core® sleeve into the soil column for continuous soil core collection.

4.5.1.4 Hand Auger

A stainless steel or aluminum hand auger is physically advanced to a desired soil sampling depth through rotation of the auger and head.

4.5.2 Soil Sampling

Soil samples will be obtained for lithologic logging and where appropriate, for laboratory analysis with one of three different sampling devices: Split barrel spoon sampler, hand auger, or Geoprobe® soil sampler. For either method, the sampling devices are lowered through the hollow-stem augers or open borehole to allow sampling of undisturbed sediments below the bit or drive shoe. Soil samples will be collected at regular intervals for subsurface characterization and selection of appropriate well screen interval(s). Soils which appear to be visually impacted or from intervals which exhibit the highest deflections on the screening device (PID or similar) will be sampled for laboratory analysis in accordance with an approved sampling plan.

4.5.2.1. Split barrel spoon sampler (split spoon)

The split spoon sampler will be driven into the soil column in accordance with ASTM Standard Method D1586 (Reference A6, Appendix E). Soil sampling by split spoon is characterized by drilling a borehole with a hollow-stem auger to the desired sampling depth (the standard calls for one sample per five foot depth interval). The split spoon sampler is attached to the drilling rods after removal of the auger plug. The drill operator will drive the sampler into the undisturbed soil by repeatedly striking the drilling rods with a 140 pound safety hammer over a 30 inch drop. Field personnel will record the number of blows required to drive the split spoon sampler for each successive six-inch interval. After the sampler has been filled, the driller will remove the rods and sampler from the borehole and should provide the intact sampler to field personnel for opening (the drive shoe and head can be loosened). Field personnel should split the spoon, scan with PID, measure sample recovery, thoroughly describe the soil lithology, note visual observations and odors, note degree of saturation, and where applicable collect soil sample(s) utilizing a stainless steel or disposable scoop. An approved, retractable knife may be used to trim the top and edges of the sample, and once prepared the sample should be containerized in appropriate sample containers.

4.5.2.2. Geoprobe®

The Geoprobe® operator will advance the drilling rods into the subsurface using a truck or track-mounted drill with a hydraulic hammer. A dedicated Geoprobe® Macro-Core® liner is

inserted into the core barrel to collect continuous core samples, usually one per 4 foot interval. The Geoprobe® operator will remove the soil filled liner from the core barrel, cut the liner, and provide field personnel with the intact cores. After retrieval of the sample, the liner may be removed by field personnel and the soil core should be scanned with a PID and logged, including documentation of core recovery, soil lithology, visual observations and odors, and degree of saturation. Where applicable, field staff should remove the soil sample utilizing a stainless steel or disposable scoop and containerize in an appropriate sample container.

4.5.2.3. Hand Auger

The self-powered hand auger allows for soil from the desired interval to be collected directly through removal of the soil sample that is collected in the auger head for every six inches of advancement.

4.6 Methodology for Leaded Tank Bottoms Soil Sampling

Leaded tank bottom material is described as containing materials distinguished by distinctive rust/red to black, metallic, mostly oxidized scale materials, sometimes in a matrix of petroleum wax sludge. The approach for identifying leaded tank bottom materials is summarized below:

- If materials are encountered within the previously designated leaded tank bottom areas, matching the physical description given above for leaded tank bottoms, then samples should be collected for lead analysis.
- If total lead results are above the site-specific standard (SSS) for lead of 2,240 milligrams per kilogram (mg/kg) then samples should be analyzed for lead via Toxicity Characteristic Leaching Procedure (TCLP), EPA Test Method 1311.
- Delineated areas that exhibit soils that physically resemble leaded tank bottoms, exhibit lead concentrations greater than 2,240 mg/kg, and exceed 5 milligrams per liter (mg/l) for lead in the TCLP leachate (which is characteristically hazardous for lead) will retain the leaded tank bottom designation. If no soils are encountered that meet all three of these criteria, then the area will no longer be classified as a leaded tank bottom area.

4.7 Methodology for Monitoring Well or Recovery Well Installation

4.7.1 Well Construction

After drilling to a desired terminal depth via any of the drilling methods referenced above, permanent monitoring wells can be installed to allow access to groundwater for future monitoring and groundwater sampling. In general, monitoring wells are constructed of pipe with a slotted interval(s) (screen) through which groundwater can flow into the well from a desired water-bearing stratum. In most cases, PVC materials are utilized for monitoring well construction.

- For applications where LNAPL thickness measurement is necessary, the screened interval should extend above the presumed highest groundwater level.
- For applications where the shallowest groundwater interval is to be monitored (e.g., water-table aquifer), a single well casing is installed.
- For applications where multiple water bearing strata will be penetrated and where deep groundwater conditions are selected for monitoring, a double-cased well may be installed to prevent the vertical migration of contaminants to the deeper water bearing zone from shallower zone(s).

Each well construction type and considerations for field staff regarding how many casings are needed have been provided below.

4.7.1.1 Single Casing Construction

The most commonly installed monitoring well at the facilities have single casings and are constructed of PVC. To determine the length of screen used, seasonal groundwater table or tidal fluctuations should be considered to allow the water table to intercept the well screen throughout the year. Field personnel should advise the driller on the required well diameter, total well depth, screen interval, screen length, and slot size based on available subsurface information prior to drilling. Once the borehole is completed and the drilling crew has been advised on the desired construction, the drilling crew will thread the well screen onto an end cap at the wellhead and will lower the well into the borehole, adding lengths of casing until the terminal depth is reached.

While the well is held near the center of the borehole, the annular space between the well screen and formation is carefully backfilled with a sand filter pack, which consists of clean,

sorted quartz sand sized to the formation grain size (typically #1 or #2 sand). The sand pack establishes continuity with the formation and acts as a filter to prevent soil from entering the well (the well screen slot size should be sized according to the formation median grain size to mitigate sediment intrusion, however is most commonly available from suppliers as 0.01 or 0.02-inch diameter slot size).

The sand pack should extend one to two feet above the top of well screen, and care must be taken by the driller to not bridge the sand or overshoot the top of sand target depth (particularly when installing wells through the auger stem). Above the sand pack, a seal (grout) is installed in the annular space between the well casing and the soil. The seal is comprised of hydrated bentonite, sometimes amended with pellets or a grout consisting of hydrated Portland cement, bentonite powder, or a blend of the two. A conventional grout blend is 95% Portland cement and 5% bentonite powder. The purpose of the seal is to prevent surface water from infiltrating the well screen. It is installed from the top of the sand to one to two feet below ground surface.

In circumstances where the top of well sand terminates below the water table (e.g., deeper groundwater or submerged screen), grout should be mixed into a slurry at the ground surface and pumped via tremmie pipe or hose to prevent bridging. Above the well seal, the annular space can be backfilled with granular bentonite or concrete. A cement cap or well pad is placed at the surface to further mitigate potential infiltration of surface water. A locking, steel protective casing (stand pipe) or a locking, flush-mounted curb box should be installed to protect the well.

4.7.1.2 Double Casing Construction

Construction of a double cased well is similar to that of a single case well; however, to prevent groundwater infiltration from shallower water bearing zones, a second casing is installed through a surface casing. This type of construction requires drilling two different diameter boreholes.

During drilling through the shallower groundwater bearing zone(s), a larger diameter borehole is drilled and should be sized according to the desired well and/or outer casing diameter. This may require reaming of the borehole depending on the conditions and

drilling equipment. An outer (surface) casing is installed and the annulus is grouted. After the outer casing is installed and the grout has set, the borehole is advanced through the surface casing with a smaller diameter drill stem and bit. When the desired terminal depth is reached, a monitoring well is installed through the inner casing using the above-referenced single casing construction procedure (the annular space between the outer and inner casings above the well filter sand should be pressure grouted).

4.7.2 Handling of Soil Cuttings

Soil cuttings generated during drilling will be containerized or stockpiled on plastic until sampling and analytical data can be obtained. Soil cutting final placement (onsite soil reuse or offsite disposal) will be performed in accordance with Pennsylvania Department of Environmental Protection (PADEP) approved onsite soil reuse plans for each facility.

4.7.3 Well Development

After installation, monitoring wells will be developed to remove residual soil from within the well and filter media and to establish communication between the well and formation. Pump and surge methodology, either through use of a ditch pump or air compressor connected to black polyethylene pipe and surge block, should be utilized to successively agitate relatively clear groundwater from the well. Surging should begin from the bottom of the screened interval and continue iteratively to the top of the well screen in approximately 2 to 4-foot intervals (i.e., pump and surge each 2 to 4 foot interval of well screen several times until relatively clear discharge water is maintained, then move up to the next screen interval until all of the screen has been developed).

Alternately, a submersible pump may be used to pump water from the screened interval of shallow wells, with the screen of the well surged to evacuate silt that remains in the sand pack. The well should be alternately surged and purged until groundwater flowing from the well appears relatively free of sediments. A vacuum truck may be used for development for wells that contains product. Well development water should be managed/treated in accordance with the site-specific work plan.

4.8 Documentation

All site activities and conditions at the time of soil sampling, well installation, and well development should be recorded by field personnel in a field computer via the EDGE application or, if necessary, a field book may be used. The entry shall include the date, time, weather conditions, location (well or boring name), personnel present onsite, and the aforementioned lithologic data and well construction information. The entry shall include detailed data required to create representative soil boring lithologic logs and well as-built logs (if a well is constructed). This data should include but not be limited to soil type, soil texture (e.g., USCS), soil color, relative moisture content, depth of apparent water table, PID readings, blow counts (if split spoon samples are collected), sample recovery, total depth of borehole, length of well screen, length of well casing, sand pack interval, filter sand size, grout materials used, well seal interval, and all well construction materials. Notes should also include well development pumping rate, duration, and observations. Additional comments or observations should also be recorded, as appropriate.

5.0 LIGHT NON-AQUEOUS PHASE LIQUID (LNAPL) SAMPLING PROCEDURES

5.1 Potential Hazards

Traffic, pinch points, chemical (airborne and physical contact), and biological are all likely hazards to be encountered during LNAPL sampling, as well as slip/trip/fall potential. Additional hazards may be mentioned in the site-specific HASP and/or the daily JSA. If significant amounts of LNAPL are being handled, a Tyvek suit should also be worn.

5.2 Materials and Equipment Necessary for Task Completion

A list of equipment required to sample LNAPL from a monitoring well is presented below:

- Current site map detailing well locations;
- Field book or field computer for recording site data;
- Optical oil/water interface probe with a graduated measuring tape to 0.01 foot accuracy;
- Keys and tools to provide well access;
- Appropriate sample containers and labels. LNAPL samples will be collected in laboratory provided glassware with appropriate preservative, if applicable. A minimum of 10 ml is required for most laboratory analyses. In the case that sufficient volume is not obtained, a swabbing technique (described below) could be used;
- Sorbent pads (required for swabbing technique);
- Stainless steel or clear bottom-loading or top-loading bailer, depending on product thickness;
- Clean nylon or polypropylene bailer cord;
- Decontamination supplies;
- Blank chain-of-custody forms; and
- Cooler and ice for sample preservation.

5.3 Decontamination Requirements

During LNAPL sampling activities, dedicated sampling equipment (i.e., clear bailers, nitrile gloves, and bailer cord) may be utilized; thereby, minimizing decontamination requirements. However, a stainless steel bailer may be used and decontaminated between LNAPL sampling locations. The optical oil/water interface probe with a graduated measuring tape to 0.01 foot accuracy used to record the presence or absence and approximate thickness of LNAPL prior to sampling also requires decontamination between sampling locations. Decontamination procedures are detailed in Section 1.5.

5.4 Sampling Procedure

Immediately prior to sampling, each monitoring well should be gauged to obtain liquid levels (i.e., depth to LNAPL and depth to water) for estimation of current LNAPL thickness. Refer to Section 3.0 for appropriate well gauging procedures. Liquid level data should be recorded in a field book or field computer through the EDGE application or, if necessary, a field book.

LNAPL sampling may be performed via two different methods, based upon the LNAPL thickness/availability at the time of sampling: direct sample or swabbing. As indicated above, a minimum LNAPL volume of 10 mL is typically required by the analytical laboratory for most LNAPL characterization.

The following sequence of procedures will be implemented for the collection of LNAPL samples from monitoring wells:

1) A clean work area will be established so that sampling equipment will not come in contact with the ground surface or any other potentially contaminated surfaces near the wellhead.
2) A pre-cleaned stainless steel bailer or dedicated disposable bailer will be used for each well.
3) A new pair of nitrile gloves will be worn during sampling and replaced for each well.
4) Based on the gauged depth to LNAPL, an appropriate length of dedicated nylon or polypropylene cord will be tied to the sampling bailer.
5) An appropriately sized (i.e., 40 ml glass vial with plastic cap fitted with Teflon® lined septum) laboratory-provided sample container will be used to containerize the LNAPL sample.

6) The sampling bailer will be slowly lowered into the well until the liquid level is encountered. Once encountered, the sampling bailer should be lowered into the standing liquid column to a depth of approximately 1 foot, or other appropriate depth based on product thickness.

7) The bailer should be retrieved at a steady rate to avoid excess agitation.

8) The bailed sample should be visually evaluated for the presence or absence of LNAPL. If sufficient LNAPL volume is present (>10 ml), a direct sample of the LNAPL will be collected into the laboratory vial. If less than 10 ml of LNAPL is apparent, a sorbent pad may be used to absorb the LNAPL from the surface of the groundwater sample and the swab placed in the laboratory vial. The site-specific work plan should dictate whether a swab sample should be analyzed, or if the well should be monitored at a later date for re-sampling.

9) Labels will be completed and attached to the sample vials, indicating the sample collector's name, date, time, and location of sample; record same data in field computer or field notebook.

10) Store samples in a secure location until possession is transferred to the laboratory.

11) Nitrile gloves, bailer, bailer cord, and any other trash will be disposed of as solid waste.

5.5 Documentation

All site activities and conditions at the time of sampling should be recorded by field personnel in a field computer via the EDGE application or, if necessary, a field book may be used. The entry shall include the date, time, weather conditions, location (well name), personnel present onsite, and the aforementioned well gauging parameters. Additional comments or observations (e.g., color or apparent viscosity of LNAPL) should be recorded.

6.0 INDOOR AND AMBIENT AIR SAMPLING PROCEDURES

In preparation for indoor and/or ambient air sampling, appropriate facility personnel should be notified of intended sampling prior to mobilization. The purpose of this would be to confirm that there are not any non-routine activities occurring in the building, such as painting of indoor walls, which would cause incidental contamination of the samples.

6.1 Materials and Equipment Necessary for Task Completion

A list of equipment required to collect indoor and/or ambient air samples is presented below:

- Field data book or field computer for recording site data;
- Laboratory certified Summa canisters (standard size is 6 liters);
- Flow controllers (standard duration is 8-hours) with integrated vacuum gauge;
- Equipment for elevating sample intake height (examples: extended sampling inlets, zip ties to attach units to fencing, tables, etc);
- Camera; and
- Blank chain-of-custody forms.

6.2 Precautions to Avoid Incidental Contamination

EPA Method TO-15 is the most common method used for analysis of air samples at these sites. This method is highly sensitive to trace concentrations of volatile organic compounds (VOCs). To avoid incidental contamination:

- Do not wear cologne or fragrance on day of sampling;
- Do not use hand sanitizers or lotions;
- Do not store canisters near containers of gasoline, or any fuel; and
- Make sure there are no sources of VOCs in the vehicle used to transport the canisters.

6.3 Sampling Procedure

1) Set Up Summa Canister. Inlets of the flow controllers are to be placed in the breathing zone, approximately 4 to 6 feet above the ground surface. Elevate Summa canisters using appropriate materials available onsite or use laboratory-provided extended inlets (approximately 3 ft long sampling canes). Indoor air samples should be representative of air

in the buildings and should be placed away from obvious ventilation to outdoor air or sources of VOCs. Securely attach flow controller and extended sampling inlet if applicable.

2) Start Air Sample Collection. Open the valve. Document the initial vacuum (should be between approximately -30 inHg and -26 inHg) and the start time of the test. If the vacuum is significantly outside of the range or has a high rate of change, consider using an alternate canister or flow controller as there may be leakage.
3) Monitoring Summa Condition During Sampling Period. Several times during the sampling period, verify that the Summa is in good condition and that the vacuum is decreasing at an appropriate rate several times during the sampling period. An example of a reasonable frequency would be every two hours during an 8-hour event. During these checks, record the time, remaining vacuum, and canister condition. If necessary, obtain a permit to operate a camera, and take a least one photo of each sampling location.
4) Completing Air Sample Collection. Near the end of the sampling period, monitor the gauge more frequently. The sample collection should be stopped when the gauge reads approximately -5 inHg. At this point, close the canister valve. Record the sample end time and sample end vacuum. Ensure that the canister is labeled with the sample ID. Remove all of the attached equipment from the canister. Pack the canisters, flow controller wrapped in bubble wrap, chain of custody (additional information in the following section), and any other laboratory provided equipment back into the original packaging.

6.4 Documentation

All site activities and conditions at the time of air sampling should be recorded by field personnel. The entry shall include the date, time, weather conditions (including wind direction and start/end barometric pressure), sample locations and IDs, and personnel present onsite. Any observation that could influence the level of VOCs in the samples should be noted.

7.0 SURFACE WATER SAMPLING PROCEDURES

7.1 Field Procedures for Surface Water Sampling

7.1.1 General

Surface water sampling is performed to obtain samples for surface water bodies that are representative of existing surface water conditions. Surface water sampling (or gauging) within 3 feet of a bulkhead at certain facilities will require field personnel to wear a life vest.

Surface water sampling locations for surface water quality and groundwater interaction studies are selected based on the following:

1) Study objectives
2) Location of point surface discharges
3) Non-point source discharges and tributaries
4) Presence of structures (e.g., bridge, dam)
5) Accessibility

During surface water sampling it is important to obtain samples that are not impacted by the re-suspension of sediment produced because of improper or poor surface water sampling techniques.

7.1.2 Surface Water Sample Location Selection

Prior to conducting surface water sampling activities, the first requirement is the consideration and development of surface water sampling locations. It is important that all surface water sampling locations be selected in accordance with the work plan.

Wading for surface water samples increases the chances of disturbance of sediments from the floor of the surface water body. When wading for surface water samples be aware of potential safety and health risks. A life vest and safety line must be worn at all times where footing is unstable or when sampling in fast moving or more than 3 feet (0.9 m) deep. A two-person team is required for most surface water sampling activities. If the site conditions require the use of the life vest and safety line, the two people involved in the sampling must be competent swimmers.

Surface water samples must be collected with no suspended sediments. Surface water samples are collected commencing with the furthest downstream location to avoid sediment interference with upstream locations.

7.1.2.1 Rivers, Streams, and Creeks

Surface water samples are generally collected in areas of surface water bodies that are representative of the surface water body conditions. Representative surface water samples will usually be collected in sections of surface water bodies that have a uniform cross section and flow rate. Mixing is influenced by turbulence and water velocity, therefore the selection of surface water sampling locations immediately downstream of a riffle area (i.e., fast flow zone) will ensure good vertical mixing. These locations are also likely areas for deposition of sediment since this occurs in areas of decreased flow velocity.

Surface water sampling locations should not be established in areas near point source discharges. Surface water sampling of these source discharge points can be performed to assess the impact of these source areas on overall surface water quality. Sample tributaries as close to the mouth as possible. It is important to select surface water sample locations considering the impact downstream, including tributary flow and sediment.

In all instances, properly document all surface water sampling locations. Documentation may include photographs and tie-ins to known structures.

7.1.2.2. Sampling Equipment and Techniques

When collecting surface water samples, direct dipping of the sample container into the stream or water is acceptable unless the sample container contains preservatives. If preserved, a pre-cleaned unpreserved sample container should be used to collect the surface water sample. The surface water sample is then transferred to the appropriate preserved sample container. When collecting surface water samples, submerse the inverted bottle to the desired sample depth and tilt the opening of the sample container upstream to fill. During surface water sample collection, wading or movement may cause sediment deposits to be re-suspended and can result in biased samples. Wading is acceptable if the stream has a noticeable current and the samples are collected directly in

the sample container when faced upstream. If the stream is too deep to wade in or if addition samples must be collected at various depths, additional sampling equipment will be required. Surface water samples should be collected about 6 inches (15 cm) below the surface, with the sample bottles being completely submerged. Taking the surface water sample at this depth eliminates the collection of floating debris in the sample container.

Surface water sample collection where the flow depth is less than 1 inch (<2.5 cm) requires the use of special equipment to eliminate sediment disturbance. Surface water sampling may be conducted with a container then transferred to the appropriate sample container, or collection may be performed using a peristaltic pump. A small excavation in the stream bed to create a sump for sample collection can also be considered but should be prepared in advance to allow all the sediment to settle prior to surface water sampling activities.

Teflon™ bailers can be used for surface water sampling if it is not necessary to collect surface water samples at specific depths. A bottom loading bailer with a check ball is sufficient. When the bailer is lowered through the water, the water is continually displaced through the bailer until the desired depth is reached. The bailer is retrieved and the check ball prohibits the release of the collected surface water sample. Bailers are not suitable in surface water bodies with strong currents, or where depth-specific sampling is required. For discrete and specified depth surface water sampling, and the parameters to be monitored do not require a Teflon™ coated sampling device, a standard Kemmerer or Van Dorn sampler can be used. The Kemmerer sampler is a brass cylinder with rubber stoppers that leave the sampler ends open while the sampler is being lowered. The sampler is lowered in a vertical position to allow water to pass through. The Van Dorn sampler is plastic and is lowered in a horizontal position. For both samplers, a messenger is sent down a rope when the sampler has reached the required depth. The messenger causes the stopper on the sampler to close. The sampler is then retrieved and the surface water sample can be collected through a valve. DO sample bottles can be filled by allowing overflow using a rubber tube attached to the valve. During depth-specific surface water sampling, take care not to disturb bottom sediments.

Glass beakers or stainless steel cups may also be used to collect surface water samples if

parameter interference does not occur. The beaker or cup must be rinsed at least three times with the surface water sample prior to sample collection.

All equipment must be thoroughly decontaminated.

7.1.2.3 Field Notes for Surface Water Sampling

Record daily surface sampling activities, describe surface water sampling locations, sampling techniques, and, if applicable, provide a description of photographs taken. Visual observations are important and provide valuable information when interpreting surface water quality results. Observations include:

1) Weather conditions
2) Stream flow directions
3) Stream physical conditions (width, depth, etc.)
4) Tributaries
5) Effluent discharges
6) Impoundments
7) Bridges
8) Railway trestles
9) Oil sheens
10) Odors
11) Buried debris
12) Vegetation
13) Algae
14) Fish and other aquatic life
15) Surrounding industrial areas

The following factors should be considered for surface water sampling:

1) Predominant Surrounding Land Use: Observe the prevalent land use type in the vicinity and note any other land uses in the area which, although not dominant, may potentially affect surface water quality.

2) Local Watershed Erosion: Note the existing or potential erosion of soil in the local watershed and its movement into the stream. Erosion can be rated through visual observation of watershed stream characteristics including increases or decreases in turbidity.

3) Local Watershed Non-Point Source Pollution: This refers to problems or potential problems other than erosion and sedimentation. Nonpoint source pollution can be diffuse agricultural and urban runoff. Other factors may include feed lots, wetlands, septic systems, dams, impoundments, and mine seepage.

4) Estimated Stream Width: The estimated distance from shore at a transect representative of the stream width in the area.

5) Estimated Stream Depth: Riffle (rocky area), run (steady flow area), and pool (still area). Estimate the vertical distance from the water surface to the bottom of the surface water body at a representative depth at three locations.

6) High Water Mark: Estimate the vertical distance from the bank of the surface water body to the peak overflow level, as indicated by debris hanging in bank or flood plain vegetation, and deposition of silt. In instances where bank flow is rare, high water marks may not be evident.

7) Velocity: Record or measure the stream velocity in a representative run area.

8) Dam Present: Indicate the presence or absence of a dam upstream or downstream of the surface water sampling location. If a dam is present, include specific information detailing the alteration of the surface water flow.

9) Channelized: Indicate if the area surrounding the surface water sampling location is channelized.

10) Canopy Cover: Note the general proportion of open to shaded areas which best describes the amount of cover at the surface water sampling location.

8.0 SEDIMENT SAMPLING PROCEDURES

8.1. Introduction

Sediment sampling is conducted to obtain samples that are representative of existing chemical and/or physical conditions of sediment.

8.2 Equipment Decontamination

On environmental sites, sediment sampling equipment (e.g., split spoons, trowel, spoons, shovels, bowls, dredges, corers, scoops) are typically cleaned as follows:

1) Wash with clean potable water and laboratory detergent, using a brush as necessary to remove particulates.
2) Rinse with tap water.
3) Rinse with deionized water.
4) Air dry for as long as possible.

Additional or different decontamination procedures may be necessary if sampling for some parameters, including VOCs and metals.

8.3 Sample Site Selection

Before any sampling is conducted, the first requirement is to consider suitable sampling locations. Sampling locations should be selected in accordance with the work plan. Wading for sediment samples in lagoons, lakes, ponds, and slow-moving rivers and streams must be done with caution since bottom deposits are easily disturbed. Sampling must only be attempted where safe conditions exist and samples must be collected from undisturbed sediments. All sediment samples are to be collected commencing with the most downstream sample to avoid sediment interference with other downstream samples. A life vest and safety line should be worn in all cases where footing is unstable or where water is fast moving or over 3 feet (0.85 m) in depth. A second person may also be required for most of the sampling scenarios.

8.3.1. Rivers, Streams, and Creeks

Sediment samples may be collected along a cross-section of a river or stream in order to adequately characterize the bed material, or from specific sediment deposits as described in the work plan. A common procedure is to sample at quarter points along the cross-section of the sampling site selected. Samples may be composited as described in the work plan. Samples of dissimilar composition (e.g., grain size, organic content) should not be combined. Representative samples can usually be collected in portions of the surface water body that have a uniform cross-section and flow rate. Since mixing is influenced by turbulence and water velocity, the selection of a site immediately downstream of a riffle area (e.g., fast flow zone) are likely areas for deposition of sediment since the greatest deposition occurs where stream velocity slows.

A site that is clear of immediate point sources (e.g., tributaries and industrial and municipal effluents) is preferred for the collection of sediment samples unless the sampling is being performed to assess these sources.

8.4 Sampling Equipment and Techniques

8.4.1. General

Any equipment or sampling technique(s) [e.g., stainless steel, polyvinyl chloride (PVC)] used to collect a sample is acceptable so long as it provides a sample which is representative of the area being sampled and is consistent with the work plan.

8.4.2. Sediment Sampling Equipment and Techniques

A variety of methods may be used to collect sediment samples from a stream, river, or lake bed. Dredging (Peterson, Ponar, Van Veen), coring and scooping are acceptable sediment sample collection techniques. Precautions shall be taken to ensure that a representative sample of the targeted sediment is collected. Caution should be exercised when wading in shallow water so as not to disturb the area to be sampled. Samplers should be selected based on the interval to be sampled, type of sediment/sludge (silt, sand, gravel), and required sample volume. More than one sampler is often required to implement a sampling program at a site. The following

describes some of these methods. Manufacturer's information should be consulted to determine the limitations of each type of sampling equipment.

8.4.3 Dredging

The Peterson dredge is best used for rocky bottoms, in very deep water, or when the stream velocity is rapid. The dredge should be lowered slowly as it approaches the bottom, so as to not disturb the lighter sediments.

The Ponar dredge is similar to the Peterson dredge in size and weight. The Ponar dredge is a "clam-shell" type unit that closes on contact with the river/lake bottom. Depending on the size of the unit, a winch is required for larger units, whereas smaller units are available for lowering by a hand line. Once retrieved, the unit is opened and the sample extracted using a sample scoop or spoon. The unit has been modified by the addition of side plates and a screen on top of the sample compartment. This permits water to pass through the sampler as it descends.

The Ponar grab sampler functions by the use of a spring-latch-messenger arrangement. The sampler is lowered to the bottom of the water body by means of a rope, then the messenger is sent down to trip the latch causing the sampler to close on the sediments. The sampler is then raised slowly to minimize the disturbance of the lighter sediments. Sediment is then placed into a stainless steel bowl, homogenized, and placed into the appropriate sample container (if collecting for VOC parameters, fill the VOC jars before homogenization).

8.4.4. Corers

Core samplers are used to obtain vertical columns of sediment. Many types of coring devices are available, depending on the depth of water from which the sample is to be collected, the type of bottom material, and the length of core to be obtained. They vary from hand-push tubes to weight or gravity-driven devices to vibrating penetration devices.

Coring devices are useful in contaminant monitoring due to the minimal disturbance created during descent. The sample is withdrawn intact, allowing the removal of only those layers of interest. Core liners consisting of plastic or Teflon may also be added, thereby reducing the potential for sample contamination and maintaining a stratified sample. The samples may be shipped to the lab in the tubes in which they were collected. The disadvantage of coring devices

is that only a small sampling surface area and sample size is obtained, often necessitating repetitive sampling in order to collect the required amount of sediment for analysis. It is also often difficult to extract the sediment sample back out through the water column without losing the sample.

The core tube is pushed/driven into the sediment until only 4 inches (10 cm) or less of tube is above the sediment-water interface. When sampling hard or coarse sediments, a slight rotation of the tube while it is pushed will create greater penetration and reduce compaction. Cap the tube with a Teflon plug or a sheet of Teflon. The tube is then slowly withdrawn, keeping the sample in the tube. Before pulling the bottom part of the core above the water surface, it must be capped.

8.4.5 Scooping

The easiest way to collect a sediment sample is to scoop the sediment using a stainless steel spoon or scoop. This may be done by wading into the stream or pond and, while facing upstream (into the current), scooping the sample from along the bottom in an upstream direction. This method is only practical in very shallow water.

8.4.6 Mixing

Sediment samples collected for chemical analysis should be thoroughly mixed (except for VOCs) in a stainless steel bowl prior to placement in the appropriate sample container. Standard procedures exist for preparation of sediment samples (ASTM D3976). These should be followed or the laboratory informed of applicable procedures.

8.4.7 Air Monitoring

Prior to sediment/sludge sampling, measure the breathing space above the sample location with a PID, should the potential for volatiles be present, and use a hydrogen sulfide meter should hydrogen sulfide be present. Repeat these measurements during sampling. If either of these measurements exceed any of the air quality criteria established in the HASP, air purifying respirators (APRs) or supplied air systems will be required.

8.4.8 Sample Location Tie-In/Surveying

The recording of the sample locations and depth on the site plan is extremely important. This may be accomplished by manual measurement (i.e., swing ties), global positioning system (GPS) survey, or stadia methods. Manual measurements for each sample location should be tied into three permanent features (e.g., buildings, utility poles, hydrants). Diagrams with measurements should be included in the field book.

8.5 Field Notes

A bound field book is used to record daily activities, describe sampling locations and techniques, and describe photographs (if taken). Visual observations are important, as they may prove invaluable in interpreting water or sediment quality results. Observations shall include (as applicable) weather, stream flow conditions, stream physical conditions (width, depth, etc.), tributaries, effluent discharges, impoundments, bridges, railroad trestles, oil sheens, odors, buried debris, vegetation, algae, fish or other aquatic life, and surrounding industrial areas. The following observations should be considered:

- Predominant Surrounding Land Use: Observe the prevalent land use type in the vicinity (noting any other land uses in the area which, although not predominant, may potentially affect water quality).
- Local Watershed Erosion: The existing or potential erosion of soil within the local watershed (the portion of the watershed that drains directly into the stream) and its movement into a stream is noted. Erosion can be rated through visual observation of watershed and stream characteristics. (Note any turbidity observed during water quality assessment.)
- Local Watershed Non-point Source Pollution: This item refers to problems and potential problems other than siltation. Non-point source pollution is defined as diffuse agricultural and urban runoff (e.g., stormwater runoff). Other compromising factors in a watershed that may affect water quality are feedlots, wetlands, septic systems, dams and impoundments, and/or mine seepage.
- Estimated Stream Width: Estimate the distance from shore at a transect representative of the stream width in the area.

- Estimated Stream Depth: Riffle (rocky area), run (steady flow area), and pool (still area). Estimate the vertical distance from water surface to stream bottom at a representative depth at each of the three locations.
- High Water Mark: Estimate the vertical distance from the stream bank to the peak overflow level, as indicated by debris hanging in bank or floodplain vegetation, and deposition of silt or soil. In instances where bank overflow is rare, a high water mark may not be evident.
- Velocity: Record an estimate of stream velocity in a representative run area (see Section 12.0).
- Dam Present: Indicate the presence or absence of a dam upstream or downstream of the sampling station. If a dam is present, include specific information relating to alteration of flow.
- Channelized: Indicate whether the area around the sampling station is channelized.
- Canopy Cover: Note the general proportion of open to shaded area which best describes the amount of cover at the sampling station.
- Sediment Odors: Disturb sediment and note any odors described (or include any other odors not listed) which are associated with sediment in the area of the sampling station.
- Sediment Oils: Note the term which best describes the relative amount of any sediment oils observed in the sampling area.
- Sediment Characteristics: Note the grain size, color, consistency, layering, presence of biological organisms, man-made debris, etc. in accordance with standard ASTM soil description protocols.
- Sediment Deposits: Note those deposits described (or include any other deposits not listed) which are present in the sampling area. Also indicate whether the undersides of rocks not deeply embedded are black (which generally indicates low dissolved oxygen or anaerobic conditions).

9.0 SLUG TEST PROCEDURES

9.1 Materials and Equipment Necessary for Task Completion

Water level (data) logger capable of recording pressure and/or depth at sub-second time intervals (preferably a vented logger capable of advanced logging modes); vented, direct-read cable of sufficient length (with dessicant); interface tape/probe or water level meter; solid (mechanical) slug, pneumatic slug, or packer system [the introduction or removal of water is not recommended (e.g., bailer or bucket)]; 5 gallon bucket, traffic cones and/or barricades, deionized or distilled water and Alconox®; decontamination bucket and brush; and laptop computer or rugged reader.

9.2 Decontamination Requirements

Equipment utilized during slug testing must be thoroughly decontaminated with Alconox® and deionized/distilled water prior to and between uses at each test well to prevent cross contamination between wells. Any groundwater removed from the well during testing must be containerized and either treated and discharged to ground surface, or disposed of in an approved manner, preferably in a properly installed, onsite holding tank. If LNAPL is encountered/recovered, it should be containerized and properly disposed onsite. However, the preferred test initiation methods (solid and/or pneumatic slug) do not generate any groundwater.

9.3 Methodology for Slug Testing

Slug tests are utilized to provide in-situ estimations of hydraulic conductivity (k) in saturated media, most often in geologic formations that exhibit aquifer properties (low k media can also be tested with special consideration). Slug tests involve rapidly displacing the static water level in a well, and analyzing the well's rate and pattern of recovery back to near-static conditions. Falling head or slug-in tests involve analysis of displacement due to the addition of volume, and rising head or slug-out tests involve the analysis of displacement due to the removal of volume. Displacement is initiated using either a solid or pneumatic slug. Water level response is monitored immediately following the initial displacement and for the ensuing time period until the water level has returned to near-static level (generally within 5% of static). Water level response should be recorded using a water level (data) logger capable of recording pressure and/or depth at sub-second time intervals (preferably a vented logger). Logarithmic logging modes are preferred to shorten the data file while still providing high resolution data just after test initiation.

9.4 Field Procedures

1) Test Well Construction and Configuration - Well construction details are needed to perform slug test calculations and are important considerations when selecting appropriate wells for testing. Important as-built details include: total well depth, well screened interval(s), depth to (static) water, casing diameter, screen diameter, filter pack diameter, filter pack size, and filter pack interval. While these details should be documented on the well log, static water level and total well depth should be field-confirmed before the test. Of particular importance to the testing procedure is the relationship between static water level and well screened interval, and the degree of well development. Test results for poorly or insufficiently-developed wells may be strongly affected by drilling debris/disturbance in the formation that can create skin effects, lowering the apparent formation k. Analysis of testing data for wells screened across the water-table should consider drainage of the filter pack media. In addition, a pneumatic slug assembly should not be utilized unless the test well is screened below the water table and the water level remains above the screen throughout the test.

2) Test Setup and Initiation - Upon arrival, the test well should be gauged for static depth to water and total well depth so that the total water column length can be estimated. Well gauging data should be recorded in a rugged reader using an EDGE file, if available, or field form or book.

   a. Solid Slug

      The displacement volume of the slug is needed. It is suggested that the slug be prefabricated and calibrated for displacement volume prior to site use. Calculate the expected initial well displacement, using the slug volume and well casing radius, and deploy the data logger/cable to a depth just below that level while considering the slug length (to avoid conflict and tangling of the slug and transducer). Also consider the submergence depth limit of the data logger (usually indicated on the logger body). Generally, placing the data logger a foot or two below the bottom of the slug is good practice. Once submerged, allow the

data logger temperature to equilibrate with groundwater prior to initiating the test (up to 30 minutes).

While the data logger temperature equilibrates, secure the slug to an adequate length of disposable string or rope and hang in the well to a depth just above the water surface. Mark the string/rope to accommodate the slug length and tie off. Using the rugged reader or field computer, set up a new test (logarithmic mode or sub-second recording interval) in the data logger supplied software and start the test. Indicate in the file name the type of test and test number (e.g., rising or falling head; test 1 or 2). Once logging is initiated, quickly and smoothly lower the slug (slug-in or falling head test) to the submerged depth and tie off the string/rope (displacement should be instantaneous). Monitor the data logger data until the water level has returned to near-static level. Stop the falling head test.

Without moving the slug or data logger, set up a new test in the data logger supplied software with the same settings and indicate in the file name the type of test being performed (rising head or slug out). Start the test and once the data logger is running, instantaneously lift the slug and tie off the string/rope to its pre-test position (just above static). Monitor the data being recorded by the data logger and stop the test when the water level has returned to near-static.

b. Pneumatic Slug

If a high formation k is anticipated, solid slug removal is found to be too slow to capture well recovery, or to minimize equipment decontamination for wells with submerged screens, a pneumatic slug assembly should be utilized.

Open air release valve, secure pneumatic slug assembly to well casing and tighten coupling to provide an air tight seal. Insert the data logger/cable and deploy to the target submergence depth [it is generally best to keep the data logger shallow (~1-2 feet below static water level) and use small initial displacements to avoid dynamic recovery effects in high k formations]. Close the air release valve and attach the air pump or compressor. Pressurize the well and

use the pressure gauge to set initial displacement. Check for air leaks using a soapy water mixture and sprayer (assembly must be air tight). Allow the water level to return to static and remove the air pump. Using the rugged reader or field computer, set up a new test (logarithmic mode or sub-second recording interval) in the data logger supplied software and start the test. Indicate in the file name the type of test and test number (e.g., rising head; test number). Once logging is initiated, open the air release valve and monitor the test data. Stop the test when the water level has returned to near-static.

3) Test Monitoring and Guidelines - The following are general guidelines for slug testing performance as published by Midwest Geosciences Group in "Field Guide for Slug Testing and Data Analysis:"

- Conduct at least three or more tests per well and if possible conduct both rising and falling head test data.
- Use two or more initial displacement values (2 slug sizes or air pressures applied) that vary by an order of magnitude or more.
- Final slug test initial displacement should be nearly equivalent to the first test's displacement.
- Allow tests to run until near-static conditions are achieved (+/- 5% of static)
- Digital slug test data files collected with the data loggers and/or EDGE files should be backed up to either a thumb drive, corporate email server, and/or corporate file server immediately after collection.

4) Test Data Reduction and Processing - Prior to slug test analyses, digital data logger files should be normalized so that multiple tests conducted on the same test well can be compared for the assessment of test validity and well conditions. Reducing the data as follows:

- From each raw data file, estimate the time of test initiation and the head (depth or pressure) under static conditions.

- In each slug test data file, subtract the time of test initiation from the elapsed time and save to a new field (normalized time or test time; start of test should be time zero).
- In each slug test data file, subtract the static pressure head from the test period pressure head values and save to a new field (deviation from static).
- To normalize the deviation from static values, divide that field by the displacement expected based upon the slug volume or air pressure head applied.
- Create a graphical plot of the normalized head data versus test time for each test performed on the test well. Review the data plots and confirm that the testing data for each repeat test roughly concur. Also confirm that the actual and expected initial displacements are nearly equal.
- If repeat testing data and/or expected versus actual initial displacements vary widely, review well completion details and testing methods prior to performing further analysis (step 5 below) as the results may not be valid (e.g., the well screen interval may be poorly developed or fouled, the data logger may have moved or placed too deep in the well, slug was removed too slowly). The well may need to be retested.

5) Test Data Analysis - For the purposes of this standard operating procedural document, it is assumed that slug test analysis software will be used to apply standard solution methods to the testing data. Various computer programs are available, such as AQTESOLV Professional. Choose an appropriate test solution method by considering the following well configurations (in AQTESOLV, use the Solution Expert):

a. Submerged Screen and/or Confined Aquifer Well - If the well screen fully penetrates the intersecting aquifer, utilize the Cooper et al. Model or Hvorslev Model and analyze the curve match and/or best fit. If well is partially penetrating a confined formation, utilize the KGS Model or Hvorslev Model. If well screen is submerged in an unconfined formation, utilize the KGS Model or Bouwer and Rice Model.

b. Water-Table Intersects Well Screen - If the well screen is intersected by the water table, utilize the Bouwer and Rice Model (double straight line effect) or KGS Model.

c. Rapid Well Recovery in High k Formations - If well response to displacement is extremely rapid and normalized head plots display an oscillatory or concave-downward form, utilize the Butler and Zhan Model (most comprehensive solution available) or High-k Hvorslev Model for confined wells, or the High-k Bouwer and Rice Model.

9.5 Limitations

In general, results of slug test data analyses provide an initial estimate of formation k and have a small scale of relevance (particularly in high k settings). Slug tests can be strongly affected by the degree of well development and can be used diagnostically to assess the degree of well development. In most cases, slug testing should be performed on several wells in an area of interest to develop an understanding of the formation characteristics (e.g., heterogeneous or homogeneous formations).

10.0 PUMP TEST PROCEDURES

10.1 Materials and Equipment Necessary for Task Completion

Water-level (data) loggers (transducers) capable of recording pressure and/or depth at sub-second time intervals (preferably a vented logger capable of advanced logging modes for at least the pumping well); vented, direct-read cables of sufficient length (with dessicant packs); interface tape/probe or water-level meter; well pump (preferably a submersible pump), drop pipe and layflat or comparable discharge line of sufficient length, totalizing flow meter (recommended) and 5 gallon bucket, stop watch, rain gauge or nearby weather station; materials needed to monitor surface water bodies near the test site (e.g., staff gauge, weir, stakes, data logger, camera with permission from refinery personnel); traffic cones and/or barricades, deionized or distilled water and Alconox®; decontamination bucket and brush; laptop computer or rugged reader; portable generator or other power supply appropriate for the submersible pump; and containment (e.g., frac tank) or activated carbon filtration for the temporary staging or filtering of discharge water.

10.2 Decontamination Requirements

Equipment utilized during pumping tests must be thoroughly decontaminated with Alconox® and deionized/distilled water prior to and between uses at each test well to prevent cross contamination between wells. Any groundwater removed from the tested well must be containerized and either treated (filtered as appropriate) and discharged to ground surface, or disposed of in an approved manner, preferably in a properly installed, onsite holding tank. If LNAPL is encountered/recovered, it should be containerized and properly disposed of on or off-site.

10.3 Methodology for Pump Testing

10.3.1 Pre-test Considerations

In general, pumping tests are performed to estimate large-scale in-situ hydraulic properties of water-bearing strata in the subsurface (i.e., transmissivity and storativity) and average out local-scale heterogeneity that can limit the applicability of smaller-scale testing methods, such as slug tests. The geographical area influenced by a pumping test will be determined by the hydraulic properties of the strata being tested (including hydraulic properties of other strata supplying recharge to the pumped formation), boundary conditions, and on the duration of the test.

Pumping tests are also commonly performed to generate drawdown data from which hydraulic boundary conditions, hydraulic flow regime (e.g., anisotropy), and aquifer type (i.e., unconfined or confined, leaky confined) may be estimated. Smaller-scale pumping tests may also be utilized to address pumping efficiency and/or signal to noise ratio (pumping rate) at the pumping well, or to assist in remedial system design. However at this scale, the assumptions of some data analysis methods may not be applicable and should be considered prior to testing.

Appropriate design of a pumping test should include review of site-specific information regarding the geology and hydrogeology of the test area. Pumping test design should also consider the goal(s) of the test (i.e., scale of application of derived aquifer properties, identification of boundary influences, sources of recharge, well efficiency). This should include review of available lithologic well logs or test boring logs, geologic maps, cross sections, structure contour maps, isopach maps, and any other available information so that a conceptual model relating geologic units to hydrostratigraphic units or water-bearing strata can be developed. Additional pre-test considerations should include identification of any potential positive or negative hydraulic barriers, tidal effects, and/or influence from other wells that may be pumping in the test area. Without sufficient knowledge of factors influencing water-levels and hydrology of the test area, test results could be misinterpreted.

Often times, budget considerations and/or time limitations will necessitate the use of an existing monitoring well as the pumping well and/or existing wells as observation points. While this is generally acceptable, the wells must be screened appropriately with respect to the goals of the test and knowledge of well construction is critical to applying test solutions. Wells should also be redeveloped prior to testing if they are relatively old or if records of sufficient well development at the time of installation are not readily available.

Pumping tests can be divided into two general classifications: step-drawdown tests and constant rate tests. Step tests typically involve pumping a well at progressively higher rates or “steps” at intervals of one or two hours per step (typically up to 3 steps). They are often used to estimate the yield a well will sustain during a constant rate pumping test and to evaluate well efficiency (frictional head losses between the screen/gravel pack and the formation). Constant rate pumping tests are used primarily to evaluate hydraulic properties of water-bearing strata for design of groundwater treatment systems and/or water supply purposes (e.g., groundwater

allocation). Where budgets permit, the best pumping test approach is to first perform a step-drawdown test on the pumping well to evaluate well efficiency and sustainable yield (and to gauge whether or not the pumping well needs additional development), allow recovery to near-static conditions, and then initiate a constant rate test.

The test duration is subject to goals of the test and to budget considerations. Optimally, a constant rate test should be run until all drawdowns have stabilized or boundary conditions are identified, and gravity drainage effects are curtailed; however, this is seldom practical due to time limitations. In most instances, an 8 hour constant rate test will be adequate, and a 24 hour test will be sufficient for higher sensitivity sites. Occasionally a 72 hour pumping test is warranted, though this is usually reserved for large scale water supply work. If there are any unexplained water level anomalies observed toward the scheduled end of a test, the test should be continued if at all possible.

The approximate test flow rate needs to be determined in advance for proper pump and discharge design selection, and sizing of discharge containment. If it is not appropriate to perform a step test, sustainable yield can be estimated from slug test data or a brief (<30 minutes) pumping episode the day before the actual test. Generally, it is best to pump the test well at a rate that maximizes the signal to noise ratio (a higher pumping rate does not influence test scale and should not be used as a means to shorten the test duration).

If testing must be performed in an area where contamination is known to be present, careful consideration of the impacts of the test scale should be considered prior to testing so that the spread of subsurface contamination is not increased. If floating product (LNAPL) is present at or near the pumping well, drawdown should be limited so as to not impact uncontaminated soils below the static water table (i.e., create a “smear” zone or allow for the significant migration of free-phase product). Discharge water must be either 1) treated prior to discharge or 2) containerized for on or off-site disposal. If it is to be discharged directly on-site and allowed to infiltrate, it must be routed sufficiently far enough from the test area as to avoid any artificial recharge effects. All appropriate withdrawal and discharge permits must be obtained and complied with. If discharge water is to be treated on-site, proper contaminant loading calculations for the test flow rate, approximate contaminant loading and test duration must be performed in advance to insure treatment is sufficient. Any on-site treatment should also

include at least one discharge effluent sample analysis by an approved laboratory to document treatment effectiveness.

10.3.2 Pre-Test Water Level Monitoring

Water-level conditions in the test area should be monitored for at least one week prior to initiation of testing to identify background trends and factors influencing groundwater levels in the test area. Data loggers should be deployed in all wells to be utilized in the pumping test and set to record depth or pressure at a resolution that is high enough to identify any potential trends (generally a 15 minute recording interval is sufficient for background monitoring). A manual water level should be measured with a water-level meter or interface probe and referenced to the top of casing mark to calibrate the data logger data at the time of deployment and at sufficient intervals throughout the recording period to validate the data and provide backup data in the event that a data logger was to fail.

Ideally, groundwater levels should be static prior to starting a pumping test so that pumping influences alone can be readily evaluated. Any significant precipitation events within the previous several days (documented through use of a site rain gauge or nearby weather station) will usually result in noticeable water level changes. If there are any major water level changes observed that cannot be explained prior to testing, additional investigation into possible area influences (e.g., local well pumping or construction de-watering) should be conducted.

10.3.3 Pumping Test Set Up

Prior to starting the test, all well measuring points (i.e. top of casing) should be clearly marked and preferably surveyed to the nearest 0.01 feet in elevation. The horizontal distance between all wells utilized should be measured and illustrated on a base map. If there are any surface water bodies in the vicinity, a staff gauge (or similar measuring device) should be set up and surveyed to evaluate possible test influences on water levels or stream flow.

The preferred pump to be used for a pumping test is a submersible centrifugal pump powered by either existing site power or a portable generator. These pumps are not explosion proof, so a conductivity probe must be tied into the pump controls to alleviate any possibility of product coming into contact with the pump (if product is anticipated). If the test pump is designed to pump total fluids (e.g. air operated double diaphragm pump, jack pump, etc.) discharge must

either be containerized, or treatment must include an oil/water separator to handle any floating product. The submersible pump should be set deep enough to maintain flow during the test period or at a maximum of just above the screened interval, using a handling line to support the pump's weight [**NOTE:** extreme care must be taken that the power cord is neither bearing any of the pumps weight, nor damaged during installation due to the potential for severe electric shock]. A check valve (or two check valves) should be installed above the pump in the discharge line to prevent backflow into the well after testing.

Discharge piping from the pump should include a flow meter (preferably with totalizer), followed by a flow adjustment valve. The flow meter should be installed in a straight section of hard piping of sufficient length to avoid meter distortion caused by turbulence (typically about 10 pipe diameters on either side of the meter). In low-flow pumping tests, flow rate can be calculated by measuring the exact time required to fill a known-sized container (bucket and stop watch) several times throughout the testing period. The bucket and stop watch method of estimating flow should also be used to back up and check the flow meter data.

Precise and frequent water-level measurements (to the nearest 0.01 feet) and time denotations before, during, and after pumping tests are critical to achieving accurate test results. In terms of prioritization, data loggers should be utilized in at least the pumping well and observation wells closest to the pumping well. Wells further from the pumping well may be manually monitored, due to the reduced likelihood that early-time drawdown will be critical at distal locations. Back-up manual measurements should be collected at least hourly during the first 8 hours of the test, and then at least every 3 hours, to verify data logger measurements. Readings from the transducers are not completely reliable until they have been submerged for at least 30 minutes (sensor equilibration period). All field personnel should have watches with a second hand, and they should all be calibrated to the same time. Liquid level measurements should be obtained using an optical oil/water interface probe with a graduated measuring tape to 0.01 foot accuracy for those wells with floating product. For wells without product, a water-level meter may be sufficient. All non-dedicated probes must be properly decontaminated after each level reading to prevent any possibility of cross- contamination between wells.

Data loggers should be deployed in each selected well to a depth that will maintain submergence through the test period. Data loggers selected should be capable of being

submerged to that anticipated depth (typically noted on the instrument body). The transducer cable should be secured at the wellhead (manufacturer supplied hangers, well caps, or electrical tape/cable ties) to minimize any movement of the sensor. Care must be taken that the transducer cable is not damaged from rough edges at the well head, and that no vehicles run over the cable. The data logger installed in the pumping well will need to be installed at a depth that will maintain submergence through the test, but also remain clear of the submersible pump (and pump noise if possible). In addition, wells with floating product may require an inner PVC stilling well surrounding the data logger cable to prevent damage from contact with the product. A stilling well may also eliminate the need for any water-level corrections for product thickness.

10.3.4 Running the Test

Once the data loggers have been deployed and secured, tests should be set up in each device and each device either started or “future” started to begin logging when the pump is turned on. The data logger in the pumping well should be set to logarithmic logging mode to capture sub-second data during the early portion of the test. If possible, the pump discharge control valve should be have been pre-set (based on the step test or mini pump test) to the desired flow rate prior to turning on the pump. However, depending on the test pumps performance curves, minor flow rate adjustments are generally needed during the first hour or two of the test to correct for the additional lift required by the pump due to increasing drawdown. In addition, movement of the discharge hose after the test has been started should be avoided, since any change in the elevation of the discharge will affect the pumping rate. All changes in flow rate should be recorded and time stamped.

A minimum of two field personnel are needed to run a pumping test, with additional personnel required for tests with multiple observations wells or additional complexity. One person should be designated to turn on the pump, monitor and adjust flow rate, maintain discharge and treatment, maintain the generator, etc. The second person should be responsible for data logger management and manual water-level measurements. As a rule of thumb regarding the frequency of manual well gauging, one measurement every half minute during the first 5 to 10 minutes, followed by one measurement every 3 to 5 minutes during the first hour, one measurement every 10 to 20 minutes for the second hour, and one hourly measurement thereafter is acceptable.

Throughout the test, data loggers should be downloaded in real time through use of direct-read, vented cables (or non-vented with a barometric logger for compensation) to monitor water-level conditions. It is essential that some data reduction be accomplished in the field, so that major water level trends are recognized during the test. At a minimum, drawdown trends from the pumping well and two of the nearest monitoring wells need to be semi-log plotted against time so that deviations indicative of boundary conditions can be discerned before pumping is ceased. This will allow decisions to be made about whether the test should run longer than planned.

Generally, water quality samples are collected during a pumping test for laboratory analysis of constituents of concern. These are generally collected after the first hour of pumping and just prior to pump shutdown. If the test is of more than 24 hours duration, it is advisable to collect additional samples during the testing period. All groundwater samples should be collected following Evergreen Field Procedures.

10.3.5 Post-test Recovery

At the conclusion of the test, water level recovery data should be collected until near-static conditions are re-established. This requires the installation of a check valve in the discharge line above the submersible pump to prevent backflow. The recovery data has the advantage in that there are no variations in the curve produced due to variations in pumping rate and is independent of test length. In water-table aquifers, however, the effects of formation de-watering can cause the recovery trends to be substantially different from drawdown trends. Consequently, recovery (residual drawdown) data should be used in conjunction with drawdown data where possible.

10.3.6 Data Analysis

The data collected during pumping tests are analyzed to estimate aquifer hydraulic properties, such as transmissivity, conductivity, and storage. Data collected by transducers must be downloaded and transformed (dimensionless drawdown or displacement from static) prior to analysis. Analysis typically involves curve matching of site data to type curves established in literature for particular flow regimes. Curve matching is commonly performed utilizing computer software, such as HydroSOLV's AQTESOLV program, along with diagnostic methods and derivative analysis to best estimate aquifer properties through identification of flow regimes and conditions.

It is noted that the mathematical solutions used in pumping test analysis include many assumptions that must be considered in the context of each test area (e.g., the formation is of uniform thickness and of infinite areal extent). In addition, some of the values incorporated into typical pumping test solutions are not actually measured, but are educated estimates (e.g., porosity based on lithology, etc.). Many problems associated with pumping test data evaluation are due to not recognizing, and/or correcting for, deviations from the theoretical solution employed. Some of the more common analytical errors occur due to: partial well penetration effects, formation de-watering effects, casing storage effects, poor pumping well efficiency and/or the application of incorrect equations or units. Consequently, a thorough understanding of the underlying assumptions inherent to the solution employed is required before the validity of the results can be trusted.

CQ Quote # 0166

CQ PM: Mark Cejas

Dear Andrew,

ChemQuants is pleased to deliver this CQ Advisor package that consists of a simple petroleum characterization, a data visualization summary of the chemistry, methods strategy summary, and the chemistry data deliverable. The CQ Interpreter workstream will be quoted and invoiced separately.

Date of Delivery: 1/4/2021

Contact Name: Andrew Klingbeil

Company Name: Stantec Consulting Services, Inc.

Company Address: 1060 Andrew Drive Suite 140

Email: Andrew.klingbeil@stantec.com

Project Name: CQ Project # 0166

Client Project Name: SPMT Belmont Terminal – Confirmation Drilling and Sampling Program

Laboratory#: L2055267

CQ Methods Summary

Phase 1 Forensic Method(s)

Phase	Parameter	Matrix	# of Samples
1	Saturated Hydrocarbons 8015D (M)	Soil	1
1	PIANO VOCs EPA 8260D (M)	Soil	1
1	VOCs - EPA 8260C/5035 High & Low	Soil	1
1	Alkylated PAHs (w/ Scan) EPA 8270D(M)	Soil	1

Phase 2 Forensic Method(s)

Phase	Parameter	Matrix	# of Samples
1	TEL and TML in Water or Soil	Soil	1

CQ Interpreter Stage

Phase 1 Basic Characterization # 0166

Dear Andrew,

Please find below a basic characterization of petroleum in the project samples. The following characterization was supported by the chromatographic results from three analytical methods – 1) VOC range PIANO 8260B (M), 2) saturated hydrocarbons 8015D (M), and 3) alkylated PAHs w/ Qualitative biomarkers 8270D (M). A GC/FID chromatogram and bar graphs were produced from these data and included to support a basic characterization of the petroleum in the soil sample.

Phase 1 Data Delivery: 1/4/2021

Contact Name: Andrew Klingbeil

Company Name: Stantec Consulting Services, Inc.

Client Project Name: SPMT Belmont Terminal – Confirmation Drilling and Sampling Program

Sample - L2055267-01 (BT-5-S-9-20201210)

This project sample exhibits petroleum that is dominant in the gasoline range (figure 1). In particular, the soil sample likely contains gasoline OR a mixture of gasoline and light straight run Naphtha (figure 2,3,4).

Recommendation for Phase 2

CQ Quote #0166 lists the analytical methods that were tentatively recommended for phase 2 forensics. Organic Lead Isomer TEL and TML method is recommended for this sample. A final invoice will be delivered to you along with the complete chemistry data package, if an interpretive report and the CQ Interpreter phase is not desired – please advise ASAP.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Name:	BELMONT CONFIRMATION DRILLING	**Lab Number:**	L2055267

Case Narrative (continued)

Report Submission

January 15, 2021: Final report. The analysis of TEL and TML was subcontracted. A copy of the laboratory report is included as an addendum. Please note: This data is only available in PDF format and is not available on Data Merger.

December 30, 2020: A correction was made to the SHC instrument blank associations.

December 29, 2020: Preliminary report pending decision regarding Phase 2 analyses.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Volatile Organics

L2055267-01: The surrogate recovery is outside the acceptance criteria for 4-bromofluorobenzene (157%); however, the sample was not re-analyzed due to coelution with an obvious interference. A copy of the chromatogram is included as an attachment to this report. The sample has elevated detection limits due to the dilution required by the elevated concentrations of non-target compounds in the sample.

The WG1448547-4 LCSD recovery, associated with L2055267-01, is above the individual acceptance criteria for acrolein (131%), but within the overall method allowances. The results of the associated samples are reported; however, all positive detects are considered to have a potentially high bias for these compounds.

PIANO Volatile Organics

L2055267-01: The sample has elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Project Number:	0166	**Report Date:**	01/15/21

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

NR - No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: DU Report with 'J' Qualifiers

Project Name:	BELMONT CONFIRMATION DRILLING	**Lab Number:**	L2055267
Project Number:	0166	**Report Date:**	01/15/21

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. (Note: 'PFAS, Total (6)' is applicable to MassDEP DW compliance analysis only.). If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

Project Name:	BELMONT CONFIRMATION DRILLING	**Lab Number:**	L2055267
Project Number:	0166	**Report Date:**	01/15/21

Data Qualifiers

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene, Naphthalene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
EPA TO-12 Non-methane organics
EPA 3C Fixed gases
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B, SM4500NO2-B**

"When Quality Counts"

Analytical Report

WorkOrder:	2101165
Report Created for:	Alpha Analytical, Inc. 320 Forbes Blvd Mansfield, MA 02048
Project Contact:	Susan O'Neil
Project P.O.:	
Project:	L2055267
Project Received:	01/06/2021

Analytical Report reviewed & approved for release on 01/13/2021 by:

Yen Cao
Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in a case narrative.

Glossary of Terms & Qualifier Definitions

Client: Alpha Analytical, Inc.
Project: L2055267
WorkOrder: 2101165

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

CQ PM: Mark Cejas

Dear Andrew,

ChemQuants is pleased to deliver this CQ Advisor package that consists of a simple petroleum characterization, a data visualization summary of the chemistry, methods strategy summary, and the chemistry data deliverable. The CQ Interpreter workstream will be quoted and invoiced separately.

Date of Delivery: 3/3/2021

Contact Name: Andrew Klingbeil

Company Name: Stantec Consulting Services, Inc.

Company Address: 1060 Andrew Drive Suite 140

Phase 1 Basic Characterization # 0166

Dear Andrew,

Please find below a basic characterization of petroleum in the project samples. The following characterization was supported by the chromatographic results from three analytical methods – 1) VOC range PIANO 8260B (M), 2) saturated hydrocarbons 8015D (M), and 3) alkylated PAHs w/ Qualitative biomarkers 8270D (M). A GC/FID chromatogram and bar graphs were produced from these data and included to support a basic characterization of the petroleum in the soil sample.

Phase 1 Data Delivery: 2/19/2021

Contact Name: Andrew Klingbeil

Company Name: Stantec Consulting Services, Inc.

Email: Andrew.klingbeil@stantec.com

Client Project Name: SPMT Belmont Terminal – Confirmation Drilling and Sampling Program

Sample - L2103943-01 (ARCO-BH-21-01 (28-30))

This project sample exhibits petroleum that spans the gasoline range to the middle distillate range (figure 1). In the VOC range, the sample exhibits what may be a mixture of gasoline and another VOC range hydrocarbon containing product (figure 3). In the SVOC range, the signature confirms the presence of light to middle distillate range chemical features (figures 5, 7). The presence of a light unrefined petroleum product cannot be ruled out.

Sample - L2103943-02 (BT-18B-S-11-20210126)

This project sample exhibits petroleum that spans the gasoline range to the residual range (figure 2). In the VOC range, the signature may be related to a refinery intermediate (figure 4). In the SVOC range, the signature is pyrogenic and likely related to a manufactured gas plant (MGP) residue (figures 6, 8).

ChemQuants™
ENVIRONMENTAL FORENSICS

Recommendation for Phase 2

CQ Quote #0166 lists the analytical methods that were tentatively recommended for phase 2 forensics. Organic Lead Isomer TEL and TML method is recommended for this sample. A final invoice will be delivered to you along with the complete chemistry data package, if an interpretive report and the CQ Interpreter phase is not desired – please advise ASAP.

Project Name:	BELMONT CONFIRMATION DRILLING	**Lab Number:**	L2103943
Project Number:	0166	**Report Date:**	03/03/21

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

March 3, 2021: Final report. The analysis of organic lead was subcontracted. A copy of the laboratory report is included as an addendum. Please note: This data is only available in PDF format and is not available on Data Merger.

February 19, 2021: Preliminary report pending the decision regarding phase 2 analyses.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

PIANO Volatile Organics

L2103943-01 and -02: The samples have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the samples.

L2103943-02: The sample was re-analyzed on dilution in order to quantify the results within the calibration range. The result(s) should be considered estimated, and are qualified with an E flag, for any compound(s) that exceeded the calibration range in the initial analysis. The re-analysis was performed only for the compound(s) that exceeded the calibration range.

Alklyated PAH

L2103943-01: The sample was re-analyzed on dilution in order to quantify the results within the calibration range. The result(s) should be considered estimated, and are qualified with an E flag, for any compound(s) that exceeded the calibration range in the initial analysis. The re-analysis was performed only for the compound(s) that exceeded the calibration range.

Saturated Hydrocarbons

L2103943-01 and -02: The sample was re-extracted with the method required holding time exceeded due to suspected solvent contamination in the original extraction. The results of both extractions are reported.

The WG1462898-1 Method Blank, associated with L2103943-01 and -02, has a concentration above the

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

NR - No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: DU Report with 'J' Qualifiers

Project Name:	BELMONT CONFIRMATION DRILLING	**Lab Number:**	L2103943
Project Number:	0166	**Report Date:**	03/03/21

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. (Note: 'PFAS, Total (6)' is applicable to MassDEP DW compliance analysis only.). If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

Project Name:	BELMONT CONFIRMATION DRILLING	**Lab Number:**	L2103943
Project Number:	0166	**Report Date:**	03/03/21

Data Qualifiers

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene, Naphthalene
EPA 8260C/8260D: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D/8270E: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water

"When Quality Counts"

Analytical Report

WorkOrder: 2102F14

Report Created for: Alpha Analytical, Inc.

320 Forbes Blvd
Mansfield, MA 02048

Project Contact: Susan O'Neil
Project P.O.:
Project: L2103943

Project Received: 02/24/2021

Analytical Report reviewed & approved for release on 03/03/2021 by:

Yen Cao
Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in a case narrative.

Glossary of Terms & Qualifier Definitions

Client: Alpha Analytical, Inc.
Project: L2103943
WorkOrder: 2102F14

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

ChemQuants™
ENVIRONMENTAL FORENSICS

CQ Quote # 0166 CQ PM: Mark Cejas

Dear Andrew,

ChemQuants is pleased to deliver this CQ Advisor package that consists of a simple petroleum characterization, a data visualization summary of the chemistry, methods strategy summary, and the chemistry data deliverable. The CQ Interpreter workstream will be quoted and invoiced separately.

Date of Delivery: 2/24/2021

Contact Name: Andrew Klingbeil

Company Name: Stantec Consulting Services, Inc.

Company Address: 1060 Andrew Drive Suite 140

Email: Andrew.klingbeil@stantec.com

Project Name: CQ Project # 0166

Client Project Name: SPMT Belmont Terminal – Confirmation Drilling and Sampling Program

Laboratory#: L2104678

CQ Methods Summary

Phase 1 Forensic Method(s)

Phase	Parameter	Matrix	# of Samples
1	Saturated Hydrocarbons 8015D (M)	Soil	1
1	PIANO VOCs EPA 8260D (M)	Soil	1
1	VOCs - EPA 8260C/5035 High & Low	Soil	1
1	Alkylated PAHs (w/ Scan) EPA 8270D(M)	Soil	1

Phase 2 Forensic Method(s)

None

Phase 1 Basic Characterization # 0166

Dear Andrew,

Please find below a basic characterization of petroleum in the project samples. The following characterization was supported by the chromatographic results from three analytical methods – 1) VOC range PIANO 8260B (M), 2) saturated hydrocarbons 8015D (M), and 3) alkylated PAHs w/ Qualitative biomarkers 8270D (M). A GC/FID chromatogram and bar graphs were produced from these data and included to support a basic characterization of the petroleum in the soil sample.

Phase 1 Data Delivery: 2/19/2021

Contact Name: Andrew Klingbeil

Company Name: Stantec Consulting Services, Inc.

Email: Andrew.klingbeil@stantec.com

Client Project Name: SPMT Belmont Terminal – Confirmation Drilling and Sampling Program

Sample - L2104678-01 (BT-03-S-41-20210129)

This project sample exhibits petroleum that spans the light distillate range to the residual range (figure 1).The signature is pyrogenic and likely related to a manufactured gas plant (MGP) residue (figures 2 to 4).

Recommendation for Phase 2

CQ Quote #0166 lists the analytical methods that were tentatively recommended for phase 2 forensics. Phase 2 methods are not required. A final invoice will be delivered to you along with the complete chemistry data package, if an interpretive report and the CQ Interpreter phase is not desired – please advise ASAP.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

February 24, 2021: This final report includes the results of all requested analyses.

February 19, 2021: Preliminary report pending the decision regarding phase 2 analyses.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

PIANO Volatile Organics

L2104678-01D: The sample has elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the sample.

L2104678-01D2: The sample was re-analyzed on dilution in order to quantify the results within the calibration range. The result(s) should be considered estimated, and are qualified with an E flag, for any compound(s) that exceeded the calibration range in the initial analysis. The re-analysis was performed only for the compound(s) that exceeded the calibration range.

Alkylated PAHs

L2104678-01D: The sample has elevated detection limits due to the dilution required by the sample matrix.

Saturated Hydrocarbons

L2104678-01: The sample was re-extracted with the method required holding time exceeded due to suspected solvent contamination in the original extraction. The results of both extractions are reported.

The WG1462898-1 Method Blank, associated with L2104678-01, has a concentration above the reporting limit for TPH (C9-C44). Since the associated sample concentrations are greater than 10x the blank concentration for this analyte, no corrective action is required.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Authorized Signature: Susan E O'Neil Susan O' Neil

Project Number:	0166	**Report Date:**	02/24/21

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

NR - No Results: Term is utilized when 'No Target Compounds Requested' is reported for the analysis of Volatile or Semivolatile Organic TIC only requests.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Report Format: DU Report with 'J' Qualifiers

Project Name:	BELMONT CONFIRMATION DRILLING	**Lab Number:**	L2104678
Project Number:	0166	**Report Date:**	02/24/21

Footnotes

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. In addition, the 'PFAS, Total (6)' result is defined as the summation of results at or above the RL for: PFHpA, PFHxS, PFOA, PFNA, PFDA and PFOS. (Note: 'PFAS, Total (6)' is applicable to MassDEP DW compliance analysis only.). If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

Project Name:	BELMONT CONFIRMATION DRILLING	**Lab Number:**	L2104678
Project Number:	0166	**Report Date:**	02/24/21

Data Qualifiers

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

Project Name:	BELMONT CONFIRMATION DRILLING	**Lab Number:**	L2104678
Project Number:	0166	**Report Date:**	02/24/21

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624/624.1: m/p-xylene, o-xylene, Naphthalene
EPA 8260C/8260D: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D/8270E: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B, SM4500NO2-B**
EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.
Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D**.

Non-Potable Water
SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1**: Ammonia-N, **LACHAT 10-107-06-1-B**: Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2**: Nitrate-N**, SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300: Chloride, Sulfate, Nitrate.**

Phase 1 Basic Characterization # 0166

Dear Andrew,

Please find below a basic characterization of petroleum in the project samples. The following characterization was supported by the chromatographic results from three analytical methods – 1) VOC range PIANO 8260B (M), 2) saturated hydrocarbons 8015D (M), and 3) alkylated PAHs w/ Qualitative biomarkers 8270D (M). A GC/FID chromatogram and bar graphs were produced from these data and included to support a basic characterization of the petroleum in the soil sample.

Phase 1 Data Delivery: 3/24/2021

Contact Name: Andrew Klingbeil

Company Name: Stantec Consulting Services, Inc.

Client Project Name: SPMT Belmont Terminal – Confirmation Drilling and Sampling Program

Soil Sample - L2110583-01 (BT-22A-S-32-20210303)

This project sample exhibits a pyrogenic signature that is likely related to an MGP type source.

Recommendation for Phase 2

CQ Quote #0166 lists the analytical methods that were tentatively recommended for phase 2 forensics. Quantitative biomarkers are recommended if you feel it is need to complete a comparative dataset. A final invoice will be delivered to you along with the complete chemistry data package, if an interpretive report and the CQ Interpreter phase is not desired – please advise ASAP.

CQ Project: Exploration of MGP Waste
Project Name: Site-Wide Fate & Transport Report RIR Part 2

Introduction

ChemQuants, LLC is gratified to provide you with this report that focuses on the chemical fingerprinting results conducted recently on behalf of Stantec Consulting Services, Inc. The chemical fingerprinting analysis was carried out on one water sample and three product samples. The study was initiated to understand the chemical source nature of the contamination exhibited in the samples and time of release estimation, if possible.

I am the principal at ChemQuants, LLC, an environmental forensics firm in Santa Barbara, California. I received bachelor's degrees in Chemistry and Environmental Science from Florida International University and a Masters's in Analytical Chemistry from Florida International University. My professional experience has focused on oil spill environmental forensics. My specialties include petroleum release investigations on coastal waterways, subsurface environments at petroleum terminals and fueling stations, and "big environmental data" chemometrics and data visualization. Besides being chair at a scientific conference, I have authored numerous publications and presentations to my peers. A complete description of my professional background is available upon request.

I have been asked to answer the following questions:

- What are the petroleum characteristics expressed in the five soil and eight product samples listed below?
- What is the geographic distribution of pyrogenic residues and other manufactured gas plant-derived waste?

Client ID	Lab ID	Date Collected	Date Received	Matrix	Saturated Hydrocarbons EPA 8015D (Mod.)	Alkylated PAHs 8270D (Mod.)	VOC PIANO

S-294 (PAES)	32437-01	3/12/2020	3/14/2020	Product	X	X	X

The samples were delivered to Alpha Analytical, Inc. (Mansfield, MA) and analyzed with the following analytical methods[1]:

1) Alkylated PAHs by GC/MS (SIM) / EPA 8270D (Mod.)
2) Saturated Hydrocarbons by GC/FID / EPA 8015D (Mod.)
3) C5-C12 PIANO w/ Oxygenates and additives quantification and fingerprinting by GC/MS – full scan mode / EPA 8260B (Mod.)

Investigative methodology

The forensics quality chemical data employed data analysis techniques typically used in petroleum investigations. Petroleum refinery process and properties lines of evidence were applied and based on well-established process forensics insights. The contaminants' characterization in the product and soil samples relied on the diagnosis of petrogenic and pyrolytic (pyrogenic) signatures.

Results and Discussion

Pyrogenicity means being derived from a carbonization or combustion process. The following chemical attributes indicate pyrogenicity in the sample: a) enrichments of 5-6 ringed PAHs – illustrated as teal blue bars in figures 8,9,10; b) Greater enrichments of non-alkylated parent PAHs relative to the higher alkylated isomer series – parent PAHs are denoted with a "0" following the analyte abbreviation in the figure label; conversely, alkylated PAHs are indicated with a # > 0 following the analyte abbreviation in figure label (figures 8,9,10). Manufactured gas plant (MGP) processes are myriad[2]. The feedstock used for gas production is one of the main variables that impact the tar byproduct's chemical fingerprint. The feedstock used at an MGP plant varies from coal to oil-based. Oil-based feedstocks range from Naphtha to middle distillate gas oil to crude oil. Trace levels of the hydrocarbon feedstock used during gas production are often present at low tar byproduct levels[3].

Multiple lines of chemical evidence were employed to assess the petroleum source types and feedstock properties of petrogenic and pyrogenic residues expressed in the soil and product samples collected from the Passyunk facility (PGW) and Belmont Terminal environs (figure 1). The primary questions posed in this investigation were listed above. Chemical lines of evidence included the following: GC/FID chromatograms (figures 2,3,4); VOC range PIANO bar graphs (figures 5,6,7); parent and alkylated PAH bar graphs (figure 8,9,10); EICP profiles of light distillate range petroleum biomarkers alkylcyclohexanes

(83 m/z) (figures 11,12,13) and bicyclanes (123 m/z) (Figures 14,15,16); and EICPs of residual range petroleum biomarkers terpanes (191 m/z) (figures 17,18,19).

A geospatial map overlaid with proportional pie charts was produced to illustrate the spatial distribution of the six chemical source types (figure 1). One soil sample (BT-5) showed a mixture of three petrogenic signatures and a pyrogenic signature. One soil sample (BT-18B) showed a mixture of two petrogenic signatures and a pyrogenic signature. Three soil samples – BT-03, BT-01, and BT-22A – exhibit primarily pyrogenic residues. One product sample (MW-29) exhibited a two-part petrogenic and pyrogenic residue composition. One product sample (S-77) showed a mixture of two petrogenic signatures with one pyrogenic residue signature. One product sample (PGW-RW-3) exhibited a mixture of three petrogenic signatures and one pyrogenic signature. One product sample (S-294) was composed of a pyrogenic residue. Four product samples (RW-225, RW-209, RW-210, RW-206) were composed of two petrogenic signatures. Altogether, the following six chemical source types were exhibited with variable proportional attributes in the 13 project samples: 1) gasoline, 2) Light Naphtha-like product, 3) Benzene or Toluene enrichments, 4) Middle distillate range petroleum, 5) Residual range petroleum, and 6) Pyrogenic residue.

S-77 The GC/FID chromatogram, alkylcyclohexanes ion trace (83 m/z), bicyclanes ion trace (123 m/z), and VOC PIANO bar graph displayed the dominance and compositional attributes of a moderately weathered alkylate poor gasoline. It was evident in the GC/FID chromatogram that the additional petrogenic and pyrogenic signatures occurred at significantly lower levels relative to the gasoline. The alkylated PAH bar graph and terpanes ion-trace (191 m/z) revealed the presence of residual range petroleum laden with trace pyrogenicity.

MW-29 The GC/FID chromatogram, alkylcyclohexanes ion-trace (83 m/z), and VOC PIANO bar graph displayed the dominance and compositional attributes of a moderate to heavily weathered alkylate poor and SRG rich gasoline. It was evident in the GC/FID chromatogram that the additional pyrogenic residue occurred at a comparable proportion to the gasoline. The compositional attributes of the pyrogenic signature were evident in the PAH bar graph, the alkylcyclohexanes ion trace (83 m/z), and the bicyclanes ion trace (123 m/z).

BT-5 The GC/FID chromatogram, alkylcyclohexanes ion trace (83 m/z), and VOC PIANO bar graph displayed the dominance and compositional attributes of a VOC range mixture of a severely weathered alkylate-rich gasoline (or alkylate feedstock) with a light naphtha-like product. Relatively lower levels of a middle distillate range petroleum aspect and a pyrogenic residue were evident in the GC/FID chromatogram. Compositional attributes of the SVOC range aspects were evident in the PAH bar graph, the alkylcyclohexanes ion trace (83 m/z), and the bicyclanes ion trace (123 m/z).

BT-18B VOC PIANO bar graph displayed the dominance of a dissolved phase C2 aromatics (Benzene and Toluene) signature. The GC/FID chromatogram exhibited the different expression of a light distillate to residual range signature. The PAH bar graph, alkylcyclohexanes ion trace (83 m/z), and the bicyclanes ion trace (123 m/z) exhibited the character of the pyrogenic residue. A relatively low-level residual range petrogenic signature was apparent in terpanes ion trace (191 m/z).

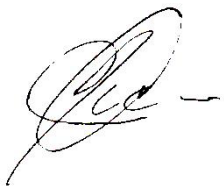
BT-03, BT-01, BT-22A, and S-294 The GC/FID chromatograms and PAH bar graphs exhibited the dominance of pyrogenicity in these samples. The character of the pyrogenic residues was evident in the PAH bar graphs, alkylcyclohexanes ion traces (83 m/z), and the bicyclanes ion traces (123 m/z).

PGW-RW-3 The GC/FID chromatogram and PAH bar graphs presented the dominance of a pyrogenic residue and residual range petroleum aspect in the sample. The compositional attributes of the pyrogenic residue were apparent in the PAH bar graph, alkylcyclohexanes ion trace (83 m/z), and bicyclanes ion trace (123 m/z). The VOC PIANO bar graph showed the lower levels of alkylate-rich gasoline (or alkylate feedstock) and light naphtha-like products.

RW-225, RW-209, RW-210, RW-206, the GC/FID chromatograms, and PAH bar graphs presented the dominance of a sulfur-rich residual range petrogenic signature in the product samples. The VOC PIANO bar graph exhibited a relatively lower-level presence of a naphtha-like product. The terpanes ion traces (191 m/z) and the shape and boiling range of the UCM in the GC/FID chromatograms exhibited the compositional attributes of the residual range petrogenic chemistry.

Conclusion

MGP pyrogenic residues were evident in two product samples and five soil samples. MGP pyrogenic residues occurred as mixtures in four samples. Three samples exhibited only MGP pyrogenic residues. One sample PGW-RW-3 from the PGW area exhibited an MGP pyrogenic residue, while seven samples collected from the Bellmont Terminal area exhibited pyrogenic residues. The MGP residues from both locations shared a similar naphtha range to the light distillate range petroleum feedstock backbone.



Sulfur-rich residual range petroleum aspects were evident in seven samples. Sulfur-rich residual range petroleum aspects were dominant in four samples collected from the PGW area. All seven samples from the PGW area exhibited a sulfur-rich residual range petroleum aspect.

Sulfur-rich residual range petroleum aspects were evident in one soil and product sample collected from the Bellmont area. Both samples were mutually enriched with pyrogenic MGP residues. These findings show the co-occurrence of MGP and sulfur-rich residual range petroleum in Belmont terminal samples that were likely related to known MGP waste sources in the PGW Site.

Upon receiving additional information, I reserve the right to modify and supplement my opinions outlined in this report.

You may email any questions or concerns to markcejas@chemquants.com regarding chemistry data or interpretation.

2) Saturated Hydrocarbons by GC/FID / EPA 8015D (Mod.)
3) C5-C12 PIANO w/ Oxygenates and additives quantification and fingerprinting by GC/MS – full scan mode / EPA 8260B (Mod.)

Investigative methodology

The forensics quality chemical data were evaluated with data analysis techniques typically used in a subsurface middle distillate to residual range petroleum investigations[2]. The chemical results were reviewed as a first step to determine the petroleum type(s) present in the samples. Weathering characteristics of the petroleum were then determined by reviewing proportions of chemistry with different susceptibility to evaporation or aqueous disolution (waterwashing). Biodegradation of petroleum was also assessed. Subsequently, the information gathered was used to determine a suitable strategy for alterations due to weathering, proper age estimations, and chemical source forensics investigation.

A site map is provided in figure 1.

Results and Discussion

Weathering and Biodegradation Properties of Middle Distillate Fuels

Weathering properties were assessed with a qualitative and ratio-based quantitative review (table 1) of the aromatic compounds in the sample. The prominent aromatic compounds were alkylated naphthalenes and phenanthrenes (figure 6). Among middle distillate hydrocarbons, n-paraffins are the first to be depleted by biodegradation and serve as the primary determinant for biodegradation (Table 1 nC17/Pr ratio & Figure 5)[3]. The middle distillate range components in AOI2-SR-21-01, AOI2-SR-21-02, and S-423-P-20210304 exhibited >95% removal of n-paraffins > 50% depletion state of the more biodegradation resistant alkylcyclohexanes (table 1; figures 5, 7). The results of the biodegradation and weathering ratios, and a review of the corresponding chemical fingerprints, suggest that the petroleum in AOI2-SR-21-01, AOI2-SR-21-02, and S-423-P-20210304 was severely impacted by biodegradation and general weathering effects.

General Petroleum Type Determinations

Petroleum mixtures were evident in AOI2-SR-21-01, AOI2-SR-21-02, and S-423-P-20210304 (see table 1 and Figure 7,8 for proportional attributes of the samples). AOI-2-TUNNEL-BILCO-2021 exhibited a residual range product.

AOI2-SR-21-01 mixture of middle distillate range and residual range petroleum. The middle distillate range aspect was dominant in the sample (figure 3). The residual range petroleum was evident in the enrichments of 3-4 ring PAHs (figure 6) and residual range biomarkers (191 m/z) (figure 9).

AOI2-SR-21-02 mixture of middle distillate range and residual range petroleum. The middle distillate range aspect was dominant in the sample (figure 3). The residual range petroleum was evident in the enrichments of 3-4 ring PAHs (figure 6) and residual range biomarkers (191 m/z) (figure 9). A VOC range severely weathered gasoline or alkylate intermediate refinery product was evident as a minor component of the mixture (Figure 3,4).

[2] Morrison, Robert D., and Brian L. Murphy. *Environmental forensics: contaminant specific guide*. Academic Press, 2010.and
[3] Wenger, Lloyd M., Cara L. Davis, and Gary H. Isaksen. "Multiple controls on petroleum biodegradation and impact on oil quality." *SPE Reservoir Evaluation & Engineering* 5.05 (2002): 375-383.

S-423-P-20210304 was a mixture of middle distillate range and residual range petroleum. The middle distillate range aspect was dominant in the sample (figure 3). The residual range petroleum was evident in the enrichments of 3-4 ring PAHs (figure 6) and residual range biomarkers (191 m/z) (figure 9). A VOC range severely weathered gasoline or alkylate intermediate refinery product was evident at a proportion comparable to the middle distillate range product (figures 3,4).

Age Estimation of the Middle Distillate Range Petroleum

Multiple lines of evidence were attempted to estimate the middle distillate fuel containing samples. The lines of evidence included organic sulfur diagnostics, signatures of HDS impacts, and a biodegradation model [4][5]. The organic sulfur diagnostics results include the fingerprint character of heterocyclic sulfur dibenzothiophenes and decalins enrichment (Table 1) and corresponding diagnostic ratios (ratios 2 to 3 – table 1; figure 2). The diagnostics suggest the presence of sulfur-rich middle distillate fuel in the three samples. The sulfur-based lines of evidence suggest a middle distillate fuel that was likely manufactured before ~1993.

A biodegradation-based index was used as an additional line of evidence to assess the middle distillate fuels' approximate age. The well-documented time-based model is a biodegradation index based on the relationship between nC17 and Pristane. Also, biodegradation-based age proxies were reinforced with a general review of biodegradation characteristics in light of the Site's potential weathering regime - as determined by the physical attributes and conditions (table 1). *Note: The weathering regime at the Site was assumed to be moderate.* The >95% depletion of n-paraffins and ~>50% depletion of Isoparaffins and Alklycyclohexanes signal biodegradation severity. The biodegradation-based age constraining line of evidence invites the interpretation that the petroleum may have exhibited a residence time of >24 years in the environment (table 1).

Middle Distillate Range Fingerprints

Middle distillate range petroleum biomarker fingerprints, specifically bicyclanes (figure 8 – 123 m/z) and Pristane and phytane (table 1 ratio 4) were reviewed to afford additional lines of evidence for source comparison. Bicyclanes and isoprenoids are among the most recalcitrant (resistant to biodegradation) hydrocarbons in the middle distillate petroleum range; thus, their signatures are valuable for exploring potential "genetic" relationships between petroleum feedstock properties. There were no appreciable differences between the middle distillate fingerprint aspects of the three samples.

Residual Range Petroleum

AOI2-TUNNEL-BILCO-2021 exhibited a residual range product "genetically" distinct from the residual range components present as mixtures in AOI2-SR-21-01, AOI2-SR-21-02, and S-423-P-20210304 (figures 6, 9). Fingerprint differences are notable in the leftward skewing of the 3 to 4-ring PAHs, enrichments of biogenic and thermally less mature PAH constituents – perylene and retene, and distributions of terpanes (191 m/z). These chemical attributes suggest contributions from a coal source.

Comparison to PAES Report 33248 (Appendix 1)

Samples SSL1 20200312 and SSL2 20200312 were evaluated in the PAES Report 33248. The middle distillate range products in AOI2-SR-21-01, AOI2-SR-21-02, and S-423-P-20210304 were similar to the middle distillate range product expressed in the water sample SSL2 20200312. Upon evaluated product samples in this report, the time of release for the middle distillate range components in water sample SSL2 20200312 was updated to ~>24 years. In addition, the residual range product expressed in SSL1 exhibited contributions of residues from the BILCO TUNNEL.

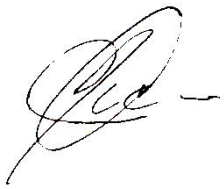
[5] Wade, Michael J. "Age-dating diesel fuel spills: Using the European empirical time-based model in the USA." *Environmental Forensics* 2.4 (2001): 347-358.



Conclusion

Multiple lines of evidence suggest that AOI2-SR-21-01, AOI2-SR-21-02, and S-423-P-20210304 contained mixtures of petrogenic sources, yet AOI2-TUNNEL-BILCO-2021 exhibited only residual range chemistry. The middle distillate range source features were intrinsically similar in the three samples. The middle distillate range products exhibited a reasonable residence time in the subsurface of ~>24 years. The residual range petroleum in AOI2-TUNNEL-BILCO-2021 was "genetically" different from the residual range petroleum in AOI2-SR-21-01, AOI2-SR-21-02, and S-423-P-20210304.

Upon receiving additional information, I reserve the right to modify and supplement my opinions outlined in this report.

3) **RESULTS AND DISCUSSIONS**
4) **CONCLUSION**

Introduction

PACE-Energy is pleased to deliver this report that focuses on the chemical fingerprinting results conducted recently on behalf of Stantec Consulting. The chemical fingerprinting analysis was carried out on two water / sheen samples. This forensics investigation was initiated to characterize and compare the hydrocarbon "fingerprints."

The following information was shared by the client:

Client ID	Lab ID	Date Collected	Date Received	Matrix	C8-C40+ SVOC Fingerprinting GC/MS
SSL1 20200312	33248-1	3/12/2020	3/14/2020	Water	X
SSL2 20200312	33248-2	3/12/2020	3/14/2020	Water	X

Aside from a brief discussion, this investigation was conducted with site and historical information provided by the client. The samples were submitted to PACE Energy Forensics Laboratory (Pittsburgh, PA) and analyzed with the following analytical method:

1) C8-C40+ Semi-Volatile Range Fingerprinting by GC/MS full scan (ASTM D5739)
2) Parent and Alkylated PAHs by GC/MS (SIM (EPA 8270 Mod)

Investigative methodology

The forensics quality chemical data were evaluated by an experienced environmental forensics expert that employed investigation techniques typically used to understand the nature of petroleum releases in the environment. The primary lines of evidence used for this report involve visual fingerprint inspection and the calculation of diagnostic ratios and that are developed from compounds of the most weathering and biodegradation resistant hydrocarbon families in petroleum. Namely – Terpanes, steranes, intra alkyl series PAHs and SPAHs, and isoprenoids.

Results and Discussion

Petroleum Characterization

Detailed Chemical Fingerprinting of SSL1 20200312 and SSL1 20200312

The shape and boiling range of the UCM in the TICs revealed the dominance of a petroleum type with hydrocarbons spanning the middle distillate range to residual range. A thorough investigation of critical chemical properties in both samples shows evidence of 1) distinct feedstock properties in both the middle distillate and residual petroleum ranges as apparent in the middle distillate UCM width, location and shape (figure 2), PAH "fingerprints" and associated diagnostic ratios (table 2 and figure 1), bicyclanes (123 m/z), terpane (191 m/z), and sterane (217 m/z) fingerprints (figures 6,7,8,9). 2) There is some evidence of unrefined middle distillate petroleum aspects in SSL1 vs distinct refinery induced stresses in SSL2. 3) There is some evidence of pyrogenic admixtures in both samples. The pyrogenic features occur at lower relative proportions to the petrogenic features in the samples. The actual source type of the pyrogenic residue is uncertain. The mixture properties of the petroleum in the samples are presented in table 1.

Middle Distillate Range Petroleum - The most apparent diagnostic signs of distinct refinery effects in the samples are a) SSL1 - lack of evidence of refinery induced stresses that are comparable to catalytic cracking, as apparent in C1-phenanthrene/anthracenes ion profiles (not shown) and ratio #5 in table 1 and figure 1. SSL2 - Diagnostic signs of thermal or catalytic cracking refinery effects are evident in the rightward skewed distribution of C1-phenanthracenes/anthracene (C1 P/A) isomers, with 1-Methylphenanthrene and 9/4 methylphenanthrene more depleted due to the associated thermal stresses. Multiple lines of evidence are presented to suggest that the middle distillate component in SSL1 is intrinsically different from the middle distillate component in SSL2. Fundamental fingerprint differences are summarized in figure 1 as well as in the following chemical diagnostic features: a) the location and shape of the middle distillate segment of the unresolved complex mixture (UCM) (figure 2); b) the relationships between two isoprenoids pristane and phytane (figures 1, 4 and table 2); c) differences in the light to middle distillate range biomarkers (figures 1, 6 and table 2); c) and differences in the relative proportions of C2-phenanthrenes and C2 dibenzothiophenes (table 2). These diagnostic differences and specific qualities of the fingerprints invite the interpretation that SSL1 may have been derived from an unrefined source, whereas SSL2 may have been derived from a refined #2 middle distillate source.

The relative proportions of C2-phenanthrenes and C2 dibenzothiophenes in combination with the distribution of C2 dibenzothiophenes isomers (not shown) suggest that the refined middle

distillate petroleum in SSL2 was likely not hydro desulfurized. This information is commonly a valuable line of evidence for age discriminations of middle distillate fuel releases. However, in this particular context there is historical evidence suggesting the storage of unfinished middle distillate fuel in the vicinity. As such, the organic sulfur based line of evidence cannot be applied defensibly for age discriminations. Biodegradation aspects of the middle distillate petroleum may be applied cautiously to gain perspective of residence time in the environment. However, it needs to be expressed that the samples were entrained petroleum in water. As such a very aggressive weathering potential regime needs to be assumed. The biodegraded character of SSL1 suggests that the sample could have been exposed to approximately 4-12 years of residence time, and the biodegraded character of SSL2 suggests that the petroleum may have experienced approximately 2-8 years of residence time in the environment (figure 3 and table 2). However, it needs to be mentioned that the petroleum in the water samples could have experienced residence time in different environmental media – from subsurface to surface settings. As such, there is a great deal of uncertainty associated to these times of release estimates that do not gain additional support from organic sulfur lines of evidence.

Residual Range Petroleum – Residual range petroleum features are evident as likely mixtures in both samples. These features are evident in the heavier UCM expression (figure 2), and presence of residual range biomarkers (figures 7, 8, 9). The relative proportions of these recalcitrant biomarkers suggest that the residual range petroleum was likely released from different sources with different feedstock attributes.

Pyrogenic Residues – Pyrogenic residues derive from combustion and pyrolysis of petroleum or coal derived feedstocks. Pyrogenicity signals the presence of residues from manufactured gas plant derived sources, or petroleum combustion sources that are ubiquitous in urban settings. These are only key examples among many possible sources of pyrogenic substances. The presence of 5-6 ring PAHs in both samples suggest the presence of pyrogenicity as an admixture in both samples (figure 10). A PAH bar graph of S-294 was shown for context. The fingerprint in S-294 was characterized as pyrogenic residue likely derived from an MGP source.

Conclusion

Multiple lines of evidence suggest that both samples contained mixtures of petrogenic and pyrogenic type sources, yet the pyrogenic features were relatively lower level admixtures. The chemical source features were intrinsically distinct in both samples, yet both samples exhibited similar relative abundances and general boiling ranges of petroleum. Both samples were dominated by middle distillate range components that were likely from different sources. Both samples contained residual range petroleum that was likely from different sources. Both samples were slightly enriched with pyrogenic residues.

CQ Project: MVA Water Expansion Report
Project Name: Site Wide Fate & Transport Report RIR Part 2

Introduction

I am the principal at ChemQuants, LLC, an environmental forensics firm located in Santa Barbara, California. I received a bachelor's degree in Chemistry, a second bachelor's degree in Environmental Science, and a Master's degree in Analytical Chemistry from Florida International University. My professional experience has focused on oil spill environmental forensics. My specialties include petroleum release investigations on coastal waterways, subsurface environments at petroleum terminals and fueling stations, and "big environmental data" chemometrics and data visualization. Besides being chair at a scientific conference, I have authored numerous publications and presentations to my peers.

ChemQuants, LLC. was hired by Stantec Consulting, Inc. to incorporate the chemistry data reports in the tables below to the overall scope presented in AOI 4 Focus Report-Evergreen Former PA Refinery Characterization (The Former Report) [1]. Expressly, this report will incorporate the VOC range PIANO chemistry, generated for water samples, to the VOC/water multivariate analysis (MVA) conducted in The Former Report. In addition, this report will review and expand on opinions generated in the said report related to water samples, including recently generated compound-specific isotope analysis (CSIA) of carbon and hydrogen for benzene, cyclohexane (CYX), and methylcyclohexane (MCYX). This review and expansion report will also consider recent additions of sucralose occurrence data from water samples.

MVA was conducted in this report to efficiently explore the chemical compositional patterns of the water data set to understand probable source patterns as a function of the overall project context that included all relevant chemical and historical information (details are included in The Former Report. The project context for this expansion report involved only the water samples.

The Fingerprint Mosaics presented the chemical distributions (figures 4 to 28). The water sample's geospatial attributes are exhibited in figure 1. Proportional petroleum type attributes expressed in the water samples were presented as geospatially overlaid pie charts in figure 2. The proportion values were estimated and provided a quick visualization of the water samples' geospatial distribution of mixture aspects.

This forensics report expanded on the molecular chemistry lines of evidence (LOEs), CSIA results for benzene and MCYX, and Sucralose. The LOEs were structured by the problem-set below. Historical background information and other details concerning the Site are contained in The Former Report. The Site and off-Site locations were associated with or adjoined to complex infrastructures, i.e., sewers, which served as probable chemical transport pathways considered in this forensics evaluation of potential source relationships and source end-members. *Aside from likely transport pathway dynamics of contaminants, this forensics report does not evaluate the possible sources of the most dissolved phase VOC constituents, i.e., benzene, toluene, and*

[1] AOI 4 Focus Report-Evergreen Former PA Refinery Characterization (Forensics Focus Report by ChemQuants)

MTBE. The potential fate, transport, environmental alterations, and sources of volatile chemical constituents were the subject of another expert report that included compounds specific isotopes (CSIA) fractionation patterns in the Former Report and the more recent Sitewide Fate and Transport RIR Part 2 – Contaminant Fate and Transport Assessment.

Problem-set definitions:

Chemical data from water samples were analyzed to address contamination concerns in the southeast zone of AOI-4. The SE zone of AOI-4 is a complex sub-surface setting of petroleum contamination that may have been derived from on-Site or off-Site sources. Possible sources of petroleum in the lower portion of the AOI-4 environs are the following (figure 1):

- Potential sources from historical off-site locations, i.e., adjacent service stations, etc., were within possible reach to AOI-4 locations from a contiguous plume geometry.

- Potential sources from historical off-site locations, i.e., adjacent service stations, etc., are not within possible reach to AOI-4 locations from a contiguous plume geometry that may have been transported by sewer-related infrastructure.

- Distant on-Site potential sources that were/are not within possible reach to AOI-4 locations from a contiguous plume geometry, i.e., on-Site potential sources (different AOI boundary) of petroleum that may have been transported by sewer or pipeline infrastructure.

- Distant off-Site potential sources that were/are not within possible reach to AOI-4 locations from a contiguous plume geometry, i.e., off-Site industrial or refinery operations that may have been transported by sewer-related infrastructure.

This problem set was investigated in The Former Report by considering historical LOEs from the IST Report, review of documents delivered by associated Site experts, and review of a remedial investigation report (Review references in The Former Report). The chemical LOEs generated in The Former Report were based on MVA and sample-by-sample reviews of water, product, and soil Fingerprint Mosaics. For this report, one MVA model was constructed with VOC PIANO data from water samples in The Former Report and three recently collected water samples (In the table below). The chemical LOEs were based on MVA, CSIA data for benzene and methylcyclohexane, occurrence data for Sucralose, and Fingerprint Mosaics. The key questions are the following:

- What are the petroleum-type characteristics of the water samples?

- What samples exhibit petroleum with potential sources from on-Site AOI-4?

- What samples in AOI-4 environs exhibit petroleum with potential sources from historical off-Site locations within possible reach of a contiguous plume geometry?

- What samples in AOI-4 environs exhibit petroleum with potential sources from distant historical off-Site locations that may have been transported by sewer-related infrastructure?

Investigative methodology

MVA analysis output, historical chemical data, expert opinions, and general Site and off-Site information were considered during formulating views in this report. Details regarding background information and results/opinions for soil and product samples are contained in The Former Report. This report expands on the multivariate analysis (MVA) and opinions for the VOC PIANO analysis in water after the inclusion of three water samples analyzed with the methods above collected in 2022. Recent results and expert opinions on the compound-specific isotope analysis (CSIA) dataset, which focused on carbon and hydrogen isotopes of benzene, toluene, cyclohexane (CYX), and methylcyclohexane (MCYX), were also considered. In addition, this report considers recent chemical occurrence data of Sucralose in water samples.

Fingerprint Mosaics

Fingerprint Mosaics™ exhibited critical fingerprint features of the samples and served as technical references for MVA and sample-by-sample evaluations (figures 4-28). Fingerprint Mosaics contain essential chemical information from the analytical chemistry reports employed for this investigation and historical documents. Respectively for the MVA model, the order of Fingerprint Mosaics followed the MVA dendrogram order from top to bottom to afford a systematic and efficient fingerprint review process. Fingerprint Mosaics consist of the following elements:

- Chemical chromatograms from GC/FID methods. The chromatograms span the VOC and SVOC ranges for product samples and only the SVOC range for water and soil samples.

- Total Ion Chromatograms (TICs) served as analogs to the chemical chromatograms from the SVOC GC/FID methods – Relevant for SVOC Full Scan data from PACE Energy data.

- Color annotated bar graphs of VOC PIANO data. The bar graph contains a color key describing the chemical classes in the data.

- Color annotated bar graphs of SVOC parent and alkylated PAH and SPAH data. The bar graph contains color keys that describe the chemical classes included in the data.

- EICPs from the SVOC analysis represent diagnostic ion scan fingerprints for different petroleum biomarker classes – Alkylcyclohexanes (83 m/z); Bicyclanes (123 m/z); Terpanes (191 m/z); Steranes (217 m/z).

Twelve water samples analyzed with the SVOC Full Scan method at PACE Energy exhibited chemical patterns annotated by colored oval shapes. PACE Energy confirmed that the chemical patterns were exogenous and derived from a sodium sulfate reagent used for sample desiccation. The laboratory noted that the chemical peaks were not saturate hydrocarbons but polar hydrocarbons co-extracted from a non-analytical grade of the reagent. The laboratory conducted tests on the reagent batches in isolation and concluded that the extracts – were blank – and did not exhibit hydrocarbons that register as petroleum-specific chemistry.

Multivariate Analysis (MVA)

One integrated MVA model was conducted for VOC data explorations on water samples. MVA, in conjunction with the review of Fingerprint Mosaics, afforded an efficient exploration of petroleum characteristics and potential similarities/dissimilarities relative to their geospatial attributes.

Data Treatment and Data Reduction

MVA models of VOC PIANO data were based on chemical concentrations data as dependent variables. Analytes excluded from the model were determined with regression analysis between Coefficient of Determination (CD) variable diagnostics vs. values derived from back-calculated concentrations. This analysis is called Miesch Scatter Plot Diagnostics[2][3]. The technique evaluated the fit of the model on a compound-by-compound basis. Essentially, compounds with poor fits to model outcomes are excluded. In addition, the most volatile and soluble compounds in the VOC PIANO dataset were excluded to minimize the effects of weathering on MVA model variances; thus, the objective of variable exclusions was to maximize the diagnostic power (DP) of the MVA model[4][5].

Integration of Methods and Workflow

After applying data treatment and reduction techniques, Principal Components Analysis (PCA), Hierarchical Cluster Analysis (HCA), and t-Distributed Stochastic Neighbor Embedding (tSNE) were integrated to facilitate a concise and visually interpretable exploration and discovery of potentially related or distinct groups of petroleum signatures. ChemQuants' (CQ) chemometrics division specializes in integrations of multivariate environmental forensics techniques[6]. PCA and HCA are conventional multivariate techniques commonly employed for data exploration and pattern recognition exercises[7]. tSNE is a non-parametric technique that is a variation of Stochastic Neighbor Embedding[8]. tSNE has been used for visualization in various applications, including genomics, computer security research, natural language processing, bioinformatics, etc.[9] CQ was the first to incorporate tSNE for an environmental chemistry data-based chemometrics workflow [6,7,8].

HCA was applied to develop an objective classification of sample fingerprint groupings. The MVA sample groups were defined from iterative reviews of HCA structures and tSNE shape expressions (Figure 3). PCA was utilized to generate loadings data to appreciate the compounds or ratios (dependent variables) that correlate with signifying the PCs of the dataset. tSNE served as a visualization tool to accurately represent and communicate the multidimensional chemometrics results as a three-dimensional map (figure 3). HCA classifications were presented as dendrograms and were symbolically integrated into the tSNE maps (figure 3). PCA output was generated as bar graphs for each PC (result not shown for brevity).

Practical perspectives:

- MVA is a tool to aid interpretations of the data to appraise potential source similarities/dissimilarities, among other possible relationships that may emerge from the inherent "structure" of the chemistry dataset. CQ should avoid deriving potential relationships between samples solely from MVA output without considering LOEs from analytical chemistry, geochemistry, and environmental forensics principles. MVA is an essential line of evidence for posing critical questions about potential relationships between sample fingerprint sources, etc. Nonetheless, CQ constantly evaluates the possible effects of mixtures, weathering, and analytical errors on MVA output before concluding expert opinions. In cases where mixtures, weathering, and analytical errors impact results from MVA, the output may result in false positive or false negative sample groupings or classifications. Essentially, MVA output does not determine the final opinion since effects from the mixture, weathering, or analytical error may result in false-negative sample source classifications or groupings. The final expert opinion regarding similarities/dissimilarities of source classifications is always rectified and reinforced with multiple LOEs.

- PCA was utilized to assess the fingerprint correlations driving the dataset's fingerprint differentiation. The correlation among compounds or diagnostic ratios is exhibited as

[9] t-distributed stochastic neighbor embedding - Wikipedia

bar graphs (output not shown), whereas the highest values signify significant correlation among principal components. The scores matrix of PCA was not employed to visualize the sample distribution across PC space; instead, tSNE was used to visualize the fingerprints differentiation scheme.

- HCA was utilized to generate objective classifications of the sample's fingerprints. Essentially, HCA was used to establish an empirical schema of fingerprint similarity/dissimilarity. The HCA numerical schema was exhibited color-coded in dendrograms and 3D tSNE maps.

- tSNE multidimensional mapping was utilized to exhibit the dataset's similarity/dissimilarity fingerprint structure color-coded with HCA classifications. The 3D map was rendered as a rotating movie for ease of review and cross-referencing.

CSIA and Sucralose to Assess Potential Transport and Intrusions of Petroleum Mass by Proximal Sewage Infrastructures.

Considering the petroleum contamination complexity historically recognized throughout on-Site and off-Site investigations, additional phases of chemical lines of evidence were warranted to study the potential transport and intrusion of petroleum mass via—proximal sewage infrastructures. Consequently, CSIA analyses of benzene, toluene, xylenes, MTBE, cyclohexane, and methylcyclohexane were conducted as a subsequent phase of chemical analysis to support VOC range molecular LOEs[10]. A complete interpretive report of CSIA chemistry data is contained in Appendix H[11].

Furthermore, to address chemical sources from sewage in the most specific manner possible, samples were collected from relevant locations and analyzed for the artificial sweetener Sucralose[12,13,14]. The sucralose investigations results were included in the main body of this report. This particular petroleum forensics focus report considers all water sample VOC range MVA output, CSIA of hydrogen and carbon for benzene, cyclohexane, and methylcyclohexane (Appendix H), and occurrence data of Sucralose in water (Main body of this report).

Results and Discussion

This investigation applies MVA methods to help develop an empirical framework for efficiently characterizing potential similarities/dissimilarities among petroleum types present in the samples. Opinion generation in this report was based on the preponderance of evidence available during the investigation. It is essential to communicate that the MVA model was based on VOC PIANO, prone to volatilization, aqueous dissolution, and biodegradation. Even though care was given to remove environmental alteration-prone compounds among the VOC range compounds available, it's essential to communicate that MVA results showing potential

similarities/dissimilarities among samples may have been impacted by environmental alteration or petroleum mixing effects.

Thus, samples exhibiting different HCA classifications and separation in the tSNE maps may have been differentially weathered variants of a similar petroleum type or impacted by mixing other products. Conversely, samples that classify in a joint MVA group may have general source type characteristics but not consistent source origins. The output of the HCA model represents a tier of evidence that affords a systematic and efficient fingerprint review process. Forensics opinions generated in this report were based on multiple levels of evidence from the HCA model, then reconciled with information from Fingerprint Mosaics, Geospatial maps, and historical project and Site documents (References in The Former Report).

Petroleum Characteristics of Water Samples

Results from the MVA analysis are illustrated in figure 3. The MVA results were shown as dendrogram's from HCA analysis, color-coded by five groups of sample fingerprints. The most soluble and volatile constituents, isopentane, MTBE, benzene, and toluene, were not included as variables in the MVA model. Biodegradation and potential source dynamics of MTBE, benzene, and toluene were evaluated in a separate report in Appendix H. Each MVA group exhibited some degree of fingerprint commonality relative to samples with registration in other groups. The results of MVA were also illustrated with 3D tSNE plots that shared consistent color annotated fingerprint group classification. The geospatial distribution of the sampling locations is shown in figure 1. The sampling points in the map were color-coded with the MVA group structure. The MVA group structure afforded an efficient exploration of petroleum characteristics and potential similarities/dissimilarities relative to their geospatial attributes.

Furthermore, the water samples were composed of petroleum mixtures. Figure 2 exhibits geospatial distributions of the mixed petroleum types as proportional pie charts. The proportions were estimated from visual inspections of chemical fingerprints in Fingerprint Mosaics (figures 4-28).

MVA Group 1:

ARCO-1 (2019) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. The SVOC range exhibited a proportionately low level of entrained petroleum likely derived from a product containing light to middle distillate range hydrocarbons (Figure 4).

S-44 (2019) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. The SVOC range exhibited a proportionately low level of entrained petroleum likely derived from a product containing light to middle distillate range hydrocarbons (Figure 5).

S-369 (2019) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. As a likely secondary mixture, the sample exhibited benzene enrichment. The SVOC range demonstrated a proportionately low level of entrained petroleum likely derived from a product containing light to middle distillate range hydrocarbons (Figure 6).

ARCO-2 (2019) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. As a likely secondary mixture, the sample exhibited benzene enrichment. The SVOC range showed a proportionately low entrained petroleum likely derived from a product containing light to middle distillate range hydrocarbons (Figure 7).

ARCO-3 (2019) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. As a likely secondary mixture, the sample exhibited benzene enrichment. The SVOC range showed a proportionately low entrained petroleum likely derived from a product containing light to middle distillate range hydrocarbons (Figure 8).

S-369 (2021) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum (Figure 9).

N-163 (2021) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. As a likely secondary mixture, the sample exhibited benzene enrichment (Figure 10).

DSCP-MW14 (2022) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. The sample exhibited benzene enrichment as a likely secondary mixture (Figure 11).

MVA Group 2:

PH-IW-10 (2022) The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. The sample exhibited benzene enrichment as a likely secondary mixture (Figure 12).

ARCO-3 (2021) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum (Figure 13).

S-449 (2020) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. As a mixture, the sample showed significant enrichment of benzene (Figure 14).

S-378 (2021) exhibited a severely weathered VOC range petroleum aspect. The signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum (Figure 15).

S-377 (2019) exhibited a severely weathered VOC range aspect. As a likely mixture, the signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum (Figure 16).

MVA Group 3:

S-279 (2019) exhibited a significant VOC enrichment of benzene. The sample showed a severely weathered xylenes, ethylbenzene, and C3 monoaromatics aspect as a likely mixture. As a likely secondary mixture, the sample showed enrichments of naphthene's that were likely derived from dissolved phase partitioning of naphtha-like petroleum. The VOC range was enriched with thiophenes (Table 1). The SVOC range exhibited entrained petroleum likely derived from a middle distillate fuel oil (Figure 17).

S-279 (2021) exhibited a significant VOC range enrichment of benzene. The sample showed a severely weathered xylenes, ethylbenzene, and C3 monoaromatics aspect as a likely mixture. As a likely secondary mixture, the sample showed enrichments of naphthene's that were likely derived from dissolved phase partitioning of naphtha-like petroleum. The VOC range was enriched with thiophenes (Table 1). The SVOC range exhibited entrained petroleum likely derived from a middle distillate fuel oil (Figure 18).

MVA Group 4:

DSCP-MW65 (2022) exhibited significant VOC range enrichments of TBA and benzene. As a likely mixture, the sample showed a severely weathered VOC range aspect reflected in the EX C2 monoaromatics complex. The SVOC range showed entrained petroleum likely derived from a light distillate range petroleum (Figure 19).

S-240 (2019) exhibited significant VOC range enrichments of MTBE and benzene. As a likely mixture, the sample showed a severely weathered VOC range aspect. The SVOC range showed entrained petroleum likely derived from a light cycle oil or heavy gas oil (Figure 15).

S-378 (2019) exhibited a significant VOC range enrichment of benzene. As a likely mixture, the sample showed a severely weathered VOC range aspect. As a likely secondary mixture, the signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. The sample was enriched with VOC range sulfur thiophenes. The SVOC range exhibited entrained petroleum likely derived from a product containing light to middle distillate range hydrocarbons (Figure 18).

S-223 exhibited a significant VOC range enrichment of benzene. As a likely mixture, the sample showed a severely weathered VOC range aspect. As a likely secondary mixture, the signature was enriched with naphthene's that were likely derived from dissolved phase partitioning of naphtha-like petroleum. The sample was enriched with VOC range sulfur thiophenes. The SVOC range exhibited entrained petroleum likely derived from a product containing light to middle distillate range hydrocarbons (Figure 19).

S-374 (2019) exhibited a significant VOC range enrichment of toluene. As a likely mixture, the sample exhibited a severely weathered VOC range aspect. As a likely secondary mixture, the signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. The SVOC range exhibited entrained petroleum likely derived from a product containing light to middle distillate range hydrocarbons (Figure 20).

S-376 (2019) exhibited a significant VOC range enrichment of toluene. As a likely mixture, the sample showed a severely weathered VOC range aspect. As a likely secondary mixture, the signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. The SVOC range exhibited entrained petroleum likely derived from a product containing light distillate range hydrocarbons (Figure 21).

S-375 (2019) exhibited a significant VOC range enrichment of benzene and toluene. As a likely mixture, the sample showed a severely weathered VOC range aspect. As a likely secondary mixture, the signature was enriched with naphthene's likely derived from dissolved phase partitioning of naphtha-like petroleum. The SVOC range exhibited entrained petroleum likely derived from a product containing light distillate range hydrocarbons (Figure 22).

MVA Group 5:

RW-703 exhibited a significant VOC range enrichment of C2 monoaromatics toluene and benzene. As likely a low-level mixture, the sample showed a severely weathered C3 monoaromatics aspect. The SVOC range exhibited entrained petroleum probably derived from a light cycle oil or heavy gas oil (Figure 8).

Penrose System Effluent exhibited a significant VOC range enrichment of C2 monoaromatics toluene and benzene. As likely a low-level mixture, the sample showed a severely weathered C3 monoaromatics aspect. The SVOC range exhibited entrained petroleum probably derived from a middle distillate fuel oil product (Figure 9).

Exploring Potential Origins of Petroleum Contamination in the Southeast AOI-4 Environs (Expansion Report)

See The Former Report for the broader extent of opinions and discussions. This report will expand on the MVA for VOC in water results after the addition of three new samples and the generation of new CSIA chemistry data and sucralose occurrence data.

Shared VOC Chemical Fingerprint Attributes in the Water Samples

MVA data explorations led to the discovery of five groups of samples that shared source fingerprint attributes.

MVA Group 1 water samples ARCO-1 (2019), S-44 (2019), S-369 (2019), ARCO-3 (2019), ARCO-2 (2019), S-369 (2021), N-163 (2021), and DSCP MW-14 (2022) shared common fingerprint aspects explained visually in the HCA group structure and clustering in tSNE space (Figure 3). A review of PCA loadings and Fingerprint Mosaics shows two hidden variables related to the samples. The first hidden variable was explained by the dominance of the naphthene's aspect in the sample's fingerprints relative to the entire population of water samples. The second hidden variable was defined by the relative magnitude of the naphthene's aspect relevant to the Group 3 samples. The only difference between group 1 and group 2 samples was the absence of the minor source aspect in Group 1 samples. Group 2 is a source "end member," and its mixing with Group 1 samples is evident in the radial orientation of the points in the tSNE space (Figure 3). Implications of these findings were discussed in the final sections of this report (Figures 1, 2, 3).

MVA Group 2 water samples S-378 (2021), ARCO-3 (2021), S-449 (2020), S-377 (2019), and PH-IW-10 (2022) shared common chemical fingerprints aspects explained visually in the HCA group structure and clustering in tSNE space (Figure 3). A review of PCA loadings and Fingerprint Mosaics shows two hidden variables related to the samples. The first hidden variable was explained by the significant enrichments of the naphthene's aspect. Notably, the main difference between Group 1 and group 2 samples was the magnitude of the naphthene's aspect relative to other minor source aspects present in Group 1 samples. Essentially, the only difference between group 1 and group 3 samples was an additional minor source aspect in Group 1 samples. This

linear mixing gradient is evident in the radial orientation of the points in tSNE space (Figures 1,2,3).

MVA Group 3 water samples S-279 (2019) and S-279 (2021) shared common chemical fingerprint aspects explained visually in the HCA group structure and clustering in tSNE space (figure 3). A review of PCA loadings and Fingerprint Mosaics shows three hidden variables related to the samples. The severely depleted ethylbenzene and xylenes aspect explained the first hidden variable. The unique attributes of the C3 explained the second hidden variable of the C4 monoaromatics complex. The third hidden variable was described by the more significant relative enrichments of the naphthene's aspect: the Group 3 and Group 4 water samples clustered on-Site in the southeastern zone of AOI-4. (Figures 1, 2, 3).

The second hidden variable was explained by the relatively lower-level unique assemblages of C2-monoaromatics toluene, ethylbenzene, xylenes, and C3 to C4 monoaromatics. Two Group 4 samples, S-449 and S-378, clustered of-Site from the southeastern AOI-4 boundary near the intersection of Penrose Sewer and Side Intercepting Sewer. The third sample in the MVA group, ARCO-3 (2021), was collected from an off-Site location near the intersection of the Side Intercepting Sewer and Pollock Street Sewer. Multiple evidence lines, including CSIA of the naphthene's and reconnaissance of Sucralose occurrences from on-Site and off-Site locations, indicated that the ARCO-3 environs likely represented the source origin naphthene's aspect. Implications of these findings were discussed in the final sections of this report (Figures 1, 2, 3).

MVA Group 4 contains the greatest number of water samples with shared fingerprint aspects. The common features were explained visually in the HCA group structure and point distributions in the tSNE space (Figure 6). Group 4 contained S-240 (2019), CD-14 (2020), S-377 (2019), S-378 (2019), S-223 (2019), S-374 (2019), S-376 (2019), S-375 (2019), and DSCP-MW65 (2022). A review of PCA loadings and Fingerprint Mosaics shows four hidden variables related to the samples. The first hidden variable was explained by the unique distribution of severely weathered gasoline-like C3-monoaromatics. The second hidden variable was explained by the intermediate levels of the naphthene's aspect relative to the entire population of water samples. (Figures 1, 2, 3).

The third hidden variable was explained by variations of the xylenes and ethylbenzene C2 monoaromatic complex relative to the C3-monoaromatics complex. The fourth hidden variable was defined by the specific properties and relative enrichments of olefins and other nC4 to nC5 boiling range isoparaffins. Multiple evidence lines, including non-chemistry weights of evidence, CSIA of benzene, xylenes, and toluene, and a survey of Sucralose occurrences from on-Site and off-Site locations, indicated that source origins of finished gasoline were likely derived from environs off-Site from AOI-4. Implications of these findings were discussed in the final sections of this report (Figures 1, 2, 3).

MVA Group 5 water samples RW-703 (2019) and Penrose System Effluent (2019) shared common chemical fingerprint aspects explained visually in the HCA group structure and clustering in tSNE space (figure 3). A review of PCA loadings and Fingerprint Mosaics shows two hidden variables related to the samples. The first hidden variable was explained by the near absence of a naphthene's fingerprint aspect. The unique attributes of the xylenes, ethylbenzene, and C3 to C4 monoaromatics complex described the second hidden variable. The Group 3 and Group 5 water samples are clustered on-Site in the southeastern zone of AOI-4. (Figures 1, 2, 3).

Source Origins of Benzene, Toluene, and MTBE

See Appendix H.

Reconnaissance of Sucralose Occurrences in Water from AOI-4 On-Site and Offsite Locations

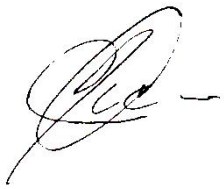
Sucralose served as a specific tracer for wastewater intrusions to groundwater bodies within the AOI-4 boundary, other locations within the boundary of the former refinery, and off-Site locations. Results from the surveillance of Sucralose occurrences were presented in the main body of this report. Sucralose occurrences in water from areas adjacent to off-Site sewage infrastructure, in conjunction with other weights of evidence presented in this report, the CSIA report in Appendix H, the main body of this report, and The Former Report, provided defensible weights of evidence of sewer leaks into groundwater, and consequently alternative transport pathways of contaminants via. Off-Site sewage infrastructure.

Transport of Dissolved Phase Naphtha-like Signature (Naphthene's Enrichment) via. Sewer Infrastructure

This report expanded on the MVA analysis conducted on VOC range PIANO analysis on water samples. This report considered new information from CSIA analysis (Appendix H) and sucralose occurrence data (main body of this report). The MVA analysis shows that the dissolved phase naphthene's signature and its mixing with other petroleum types explained most of the numerical variation of the model. The proportional pies map in figure 2 supports the MVA investigation and corresponding groupings in figure 1 by illustrating the geographical distribution of the naphthene's dominant part of the petroleum mixtures in the water samples. The geographical distributions and probable source dynamics of the benzene and toluene, were discussed in Appendix H. In contrast, the geographical distributions, and probable sources, of the middle distillate and residual range petroleum aspects, were discussed in The Former Report.

Figure 2 illustrates the mixing dominance of the dissolved phase naphthene's signature in water samples collected from the AOI-4 and on-site and off-site environs more proximal to AOI-1. The commonality of the molecular naphthene's fingerprint was apparent in the groupings structure of the MVA analysis along with the Fingerprint Mosaics in figures 4 to 28. CSIA of hydrogen and carbon, for benzene, toluene, and naphthene's (CYX and MCYX), in addition to determinations of Sucralose from co-located samples, were conducted to afford additional tiers of evidence to explore chemical source similarities or dissimilarities.

The results of sucralose survey indicated that "Hot Spots" of Sucralose were detected in locations concomitant with enrichments of the naphthene's aspect and probable zones of wastewater intrusions Outfalls from the leaking sewer infrastructure (see the main body of this report). Results and expert interpretation of CSIA results of naphthene's CYX showed scatter plot "clustering" of chemical fractionation patterns (of related carbon and hydrogen atoms) for water samples - ARCO-3, S-369, S-378, PH-IW-10, DSCP-MW-14, DSCP-MW-65 and PH-DW-3 (Appendix H). Results for MCYX showed scatter plot "clustering" of chemical fractionation patterns (of related carbon and hydrogen atoms) for water samples - ARCO-3, S-369, S-378, PH-IW-10, and PH-DW-3. It is essential to recognize that CYX is more volatile than MCYX, and these physical-chemical attributes likely impacted CSIA fractionation patterns (Appendix H). CSIA results of naphthene's, in conjunction with molecular lines of evidence and sucralose reconnaissance results, showed chemical source commonalities in water samples collected from



locations impacted by wastewater intrusions from the compromised sewer infrastructure. These multiple LOEs support the likely transport of contaminants by the sewer infrastructure.

Conclusion

A comprehensive forensics investigation was conducted on water samples collected from various AOIs in the Evergreen Former Philadelphia Refinery. Multivariate statistical analysis and traditional compositional analyses were conducted on all samples procured from the research initiative. Molecular petroleum chemistry lines of evidence were reviewed from The Former Report and recent efforts. CSIA chemistry lines of evidence for benzene, toluene, xylenes, ethylbenzene, MTBE, cyclohexane, and methylcyclohexane were generated for samples wherever possible and pertinent. Sucralose lines of evidence were generated from groundwater samples collected from on-Site and off-Site locations. This report provides multiple weights of evidence generated from the VOC range chemistry of water samples. The results of this investigation discovered an alternative transport pathway of contaminants through off-Site sewer infrastructure.

APPENDIX D

AOI 8 Ball Field Technical Memorandum

Stantec

Technical Memo

To:	Tiffani Doerr, Lead Specialist Evergreen Resources Operations 2 Righter Parkway, Suite 120 Wilmington, DE 19803	From:	Stantec Consulting Services Inc. 1060 Andrew Drive, Suite 140 West Chester, PA 19380
Project/File:	213403364	Date:	June 27, 2022

Reference: AOI 8 Ball Field Site Characterization/Investigation Activities, 2019-2022
Former Philadelphia Refinery
3144 Passyunk Avenue
Philadelphia, Pennsylvania

1 Introduction

Stantec Consulting Services Inc. (Stantec) has prepared this Technical Memorandum for Evergreen Resources Group, LLC (Evergreen) summarizing site characterization/investigation activities conducted in the former Philadelphia Refinery Area of Interest (AOI) 8 Ball Field (Ball Field)(**Figure 1**) since submission of the AOI 8 Remedial Investigation Report (RIR) in 2017. The primary goal of this memo is to document recent site activities and present results of investigations intended to delineate light nonaqueous phase liquid (LNAPL) in northern AOI 8 and to gain a better understanding of groundwater flow patterns and hydrostratigraphy in the Ball Field area. Information presented in this memo is intended to be supplemental to the previously submitted AOI 8 RIR and Sitewide RIR and will be included as an attachment to the Sitewide Fate and Transport RIR.

2 Investigation Activities

The conclusions of the 2017 AOI 8 RIR with respect to groundwater state, “Along the AOI 8 boundary near the Verizon South District Work Center Property, benzene is delineated in AOI 8, but lack of offsite stratigraphic control on the presence or absence of a discrete lower aquifer limits the ability to demonstrate side gradient to up gradient delineation in the offsite direction.” With the goal of refining the understanding of stratigraphy and groundwater flow direction in this area in support of the Sitewide Fate and Transport RIR, monitoring well N-163 was installed adjacent to N-100 in 2019 and screened in the depth interval where soils in the saturated zone were observed to be impacted with petroleum in the N-100 soil boring. An additional monitoring well, N-164, was installed in 2021 to delineate petroleum hydrocarbon impacts observed during installation of N-163 and dissolved concentrations of benzene detected in groundwater at N-163. Impacts were observed during the installation of N-164, and LNAPL was observed in the well during gauging activities. High resolution site characterization (HRSC) activities were initiated in late 2021 to: 1) delineate the extent of LNAPL observed in N-164; 2) characterize petroleum impacts in the Ball Field area at large to understand the potential source(s); and 3) gain a better understanding of groundwater flow and

hydrostratigraphy in the Ball Field to support the ongoing assessment of fate and transport. These activities are discussed in more detail in the following sections.

2.1 Monitoring Well Installation, 2019-2021

In December 2019, A Stantec geologist oversaw the installation of monitoring well N-163, co-located with N-100 northwest of the Maiden Lane LNAPL body (**Figure 2**). Drilling was performed by Parratt Wolff, Inc. (PWI) using hydro-excavation (0 to 8 feet below ground surface [ft bgs]), hollow-stem auger (8 to 28 ft bgs), and mud rotary (28 to 42 ft bgs) methods. Soil was continuously logged and screened for volatile organic compounds (VOCs) with a photoionization detector (PID) during boring advancement to a depth of 42 ft bgs. Petroleum impacts were visually observed in sampling spoons and confirmed via PID measurements in the 24 to 36 ft bgs interval (**Attachment A**). Based on these field observations, a 10-foot section of 2-inch, 0.020-inch slot polyvinyl chloride (PVC) screen was installed from 28 to 38 ft bgs. The annular space was filled with No. 1 sand to approximately two feet above the screen, sealed with one foot of hydrated bentonite, and finished with tremie grout to the surface (**Table 1**). N-163 was developed by PWI via pump/surge until groundwater was observed to be free of turbidity. Groundwater and sediment generated during well development was stored onsite in totes. The liquids were emptied by Total Quality Drilling (TQD) of Mullica Hill, New Jersey using a vacuum truck and the water was treated at the facility's wastewater treatment plant.

No soil samples were collected for laboratory analysis during well installation activities. Soil cuttings generated from the installation of N-163 are currently staged onsite and will be sampled for onsite soil reuse pursuant to the Hilco Redevelopment Partners (HRP) *Soil Management Plan* as approved by the Pennsylvania Department of Environmental Protection (PADEP) on June 18, 2020.

In response to petroleum impacts observed during installation of N-163 and elevated concentrations of dissolved phase petroleum hydrocarbons present in groundwater (as discussed in **Section 2.3**) monitoring well N-164 was installed northwest of N-163. In April 2021, drilling activities were coordinated with Lewis Environmental (air knife, 0 to 6.5 ft bgs) and PWI (hollow stem auger, 6.5 to 32 ft bgs) and overseen by a Stantec geologist. As with N-163, soil was continuously logged and screened for VOCs via PID during boring advancement to a depth of 32 ft bgs. Petroleum impacts were greatest in the 18 to 21 ft bgs interval. Based on these field observations, a 10-foot section of 2-inch, 0.010-inch slot PVC screen was installed from 18 to 28 ft bgs. The annular space was filled with No. 1 sand to approximately two feet above the screen, sealed with two feet of hydrated bentonite, and finished with tremie grout to the surface. N-164 was developed by PWI via pump/surge until groundwater was observed to be free of turbidity. Groundwater and sediment generated during well development was stored onsite in totes. The liquids were emptied by TQD using a vacuum truck and the water was treated at the facility's wastewater treatment plant.

A soil sample was collected for forensics analysis in the 18 to 20 ft bgs interval (discussed in **Section 3**). Soil cuttings generated from the installation of N-164 are currently staged onsite and will be sampled for onsite soil reuse per the HRP *Soil Management Plan*.

The soil boring/well construction log for N-164 can be found in **Attachment A** and details summarized on **Table 1**.

2.2 High Resolution Site Characterization Activities, 2021 - 2022

As a means of demonstrating LNAPL delineation in the vicinity of monitoring well N-164, HRSC activities were undertaken in the Ball Field between December 2021 and January 2022. A secondary objective of the HRSC activities was to better understand the groundwater flow pattern and hydrostratigraphy in the Ball Field area utilizing Geoprobe® Direct Image® tools and through the installation of strategically placed monitoring wells.

2.2.1 OIHPT-UV TEST BORINGS

In December 2021, Stantec staked out 29 proposed boring locations in a grid-like pattern encompassing the Ball Field and surrounding area; the distance between each boring was measured at approximately 100 feet. Ground Penetrating Radar Systems LLC (GPRS) performed utility locating and mapping of underground utilities or objects in the area of the proposed borings prior to initiating ground disturbance activities. An underground utility map generated by GPRS is included as **Attachment B**. Boring locations were adjusted based on the presence of field-marked electrical, sewer, or unidentified underground lines (see **Figure 3** for final boring locations).

PWI was contracted to perform the HRSC drilling activities via Geoprobe® Direct Image® ultraviolet-range optical image profiler and hydraulic profiling tools (combination OIHPT-UV setup). As the probe tip is advanced into the subsurface, the ultraviolet (UV) light source induces fluorescence of polycyclic aromatic hydrocarbons (PAHs) if present in soil. Prior to initiating drilling, PWI tested the Geoprobe's® UV laser on LNAPL hand bailed from N-164 to confirm the LNAPL present in this monitoring well would fluoresce during vertical profiling activities as intended. Fluorescence was observed over approximately 71% of the camera lens area.

Between December 23, 2021 and January 13, 2021, a Stantec geologist oversaw the advancement of 29 soil borings using OIHPT-UV vertical profiling methods up to 40 ft bgs at each pre-selected location. Continuous air monitoring was performed in the breathing zone of field personnel with a five-gas meter (MultiRAE). Each boring location was "pre-probed" to a maximum of 5 ft bgs with Geoprobe® direct push tooling to mitigate potential damage to Direct Image® tooling from gravel- and debris-laden fill commonly encountered in the Ball Field shallow soil. Direct Image® tooling was utilized to collect real-time measurements of soil electrical conductivity (EC), fluorescence, and pressure required to inject a set flow of water into soil as the probe was advanced. An estimate of hydraulic head (K) in saturated soil was generated at the conclusion of each electronic boring log. Direct Image® electronic boring logs depicting these four parameters at each boring location are included as **Attachment C**.

An optical, HPT pressure sensor, and EC load test were performed before and after each boring was completed to verify the integrity of the collected data and to perform necessary maintenance on the probe components.

Fluorescence was observed in 28 of the OIHPT-UV borings in the saturated zone, and extensively in one OIHPT-UV boring in the unsaturated zone, AOI8-OIP-04 (see **Section 2.2.3** for further discussion on this boring). A discussion and interpretation of the Direct Image® data follows in **Section 4**.

2.2.2 MONITORING WELL INSTALLATION

Six OIHPT-UV test boring locations were selected for offset monitoring well installation based on sustained and/or peak intervals of fluorescence as recorded by Direct Image® electronic boring logs (**Attachment C**). Monitoring wells were installed via Geoprobe® direct push methods or hollow stem auger truck-mounted drilling methods where direct push methods were unsuccessful. All monitoring wells were installed by PWI using a 1-inch diameter Geoprobe® prepack well screen consisting of a standard, slotted PVC well screen pipe surrounded by a stainless-steel mesh with 20/40 mesh sand packed in between.

During soil coring activities overseen by a Stantec geologist, soil was screened with a combination of vapor monitors including a PID and/or flame ionization detector (FID) to assess for presence or absence of organic/inorganic compounds, including methane. The PID/FID was also used for continuous air monitoring in the breathing zone during well installation and soil sampling activities. Up to 5 soil samples were collected at each boring location where petroleum hydrocarbon impacts were visually confirmed or detected via PID/FID.

The wells were developed by PWI via pump/surge until groundwater was observed to be free of turbidity. Groundwater and sediment generated during well development was stored onsite in totes. The liquids were emptied by TQD using a vacuum truck and the water was treated at the facility's wastewater treatment plant. Soil cuttings generated from the installation of these wells are currently staged onsite and will be sampled for onsite soil reuse per the HRP *Soil Management Plan*.

Boring locations selected for monitoring well installation included: AOI8-OIP-08, AOI8-OIP-16, AOI8-OIP-28, AOI8-OIP-06, AOI8-OIP-07, and AOI8-OIP-23 (N-165 through N-170, respectively; see **Figure 2**). Note that two OIHPT-UV borings were performed adjacent to preexisting wells N-163 and N-164: AOI8-OIP-01 and AOI8-OIP-13, respectively. Boring/well construction logs are included as **Attachment A** and well construction details are summarized in **Table 1**. Soil analytical reports can be found in **Attachment D** and are summarized in **Table 2.** A discussion and interpretation of the laboratory results is presented in **Section 4**.

2.2.2.1 N-165

On January 18, 2022, monitoring well N-165 (**Figure 2**) was installed within five feet of OIHPT-UV boring AOI8-OIP-08 (**Figure 3**) via PWI Geoprobe® direct push methods. Per the AOI8-OIP-08 Direct Image® electronic boring log results, the initial target depth for screen installation was 24 to 34 ft bgs to capture the peak interval of fluorescence; however, persistent refusal was encountered at approximately 28 ft bgs at this location. To compromise, a 5-foot section of 1-inch diameter, 0.01-inch slot PVC prepack screen was installed between 23 to 28 ft bgs within five feet of the original borehole location where refusal was repeatedly encountered. The monitoring well was finished at ground surface with a 6-inch diameter flush-mounted cover and concrete pad.

Soil samples were collected at the following depths via dual tube liner: 24, 27, 30, and 36 ft bgs. Samples were submitted to Pace Analytical Services, LLC (Pace) of Greensburg, PA for analysis of total petroleum hydrocarbons (TPH) separated by carbon number into the gasoline (GRO; C6-C10), diesel (DRO; C10-C28), and heavier ranges for crude oil (ORO; C28-C40). The boring ID assigned to this location was AOI8-BH-22-01.

2.2.2.2 N-166

On January 19, 2022, attempts were made to install monitoring well N-166 within five feet of OIHPT-UV boring AOI8-OIP-16 via PWI Geoprobe® direct push methods. Persistent refusal was encountered at 28 ft bgs, and PWI returned on January 25, 2022, to finish the installation with a truck-mounted hollow-stem auger drill rig. Per the AOI8-OIP-16 Direct Image® electronic boring log results, a 10-foot section of 1-inch diameter, 0.01-inch slot PVC prepack screen was installed between 27 to 37 ft bgs to capture the peak interval of fluorescence observed between 27 and 35 ft bgs. The monitoring well was finished at ground surface with a 6-inch diameter flush-mounted cover and concrete pad.

Soil was continuously logged and sampled at pre-determined intervals via split-spoon. Depths selected for sampling were as follows: 27, 29, 31, 33, and 35 ft bgs. Samples were submitted to Pace for analysis of TPH separated by carbon number into the gasoline, diesel, and heavier ranges for crude oil. The boring ID assigned to this location was AOI8-BH-22-02.

2.2.2.3 N-167

On January 19, 2022, attempts were made to install monitoring well N-167 within five feet of OIHPT-UV boring AOI8-OIP-28 via PWI Geoprobe® direct push methods. Persistent refusal was encountered at 28 ft bgs, and PWI returned on January 25, 2022, to finish the installation with a truck-mounted hollow-stem auger drill rig. Per the AOI8-OIP-28 Direct Image® electronic boring log results, a 10-foot section of 1-inch diameter, 0.01-inch slot PVC prepack screen was installed between 26 to 36 ft bgs to capture the peak interval of fluorescence observed between 28 and 33 ft bgs. The monitoring well was finished at ground surface with a 6-inch diameter flush-mounted cover and concrete pad.

Soil was continuously logged and sampled at pre-determined intervals via split-spoon. Depths selected for sampling were as follows: 29, 30, and 31 ft bgs. Samples were submitted to Pace for analysis of TPH separated by carbon number into the gasoline, diesel, and heavier ranges for crude oil. The boring ID assigned to this location was AOI8-BH-22-03.

2.2.2.4 N-168

On January 26, 2022, monitoring well N-168 was installed 15 feet east of OIHPT-UV boring AOI8-OIP-06 via PWI truck-mounted hollow-stem auger drill rig. Per the AOI8-OIP-06 Direct Image® electronic boring log results, a 10-foot section of 1-inch diameter, 0.01-inch slot PVC prepack screen was installed between 17 to 27 ft bgs to capture the initial peak interval of fluorescence observed between 17 and 21 ft bgs and the second peak interval of fluorescence observed between 23 and 32 ft bgs. The monitoring well was finished at ground surface with a 6-inch diameter flush-mounted cover and concrete pad.

Soil was intermittently logged and sampled at pre-determined intervals via split-spoon. Depths selected for sampling were as follows: 20, 22, 24, 26, and 28 ft bgs. Samples were submitted to Pace for analysis of TPH separated by carbon number into the gasoline, diesel, and heavier ranges for crude oil. The boring ID assigned to this location was AOI8-BH-22-04.

2.2.2.5 N-169

On January 26, 2022, monitoring well N-169 was installed 15 feet east of OIHPT-UV boring AOI8-OIP-07, which was not advanced beyond 19 ft bgs due to persistent refusal via PWI truck-mounted hollow-stem auger drill rig. Based on field PID readings collected during soil coring, a 10-foot section of 1-inch diameter, 0.01-inch slot PVC prepack screen was installed between 25 to 35 ft bgs where impacts were observed visually and confirmed by elevated VOC concentrations via PID. Fluorescence was initially observed beginning at 14.5 ft bgs per the incomplete Direct Image® electronic boring log results for AOI8-OIP-07. The monitoring well was finished at ground surface with a 6-inch diameter flush-mounted cover and concrete pad.

Soil was intermittently logged and sampled based on visual/PID impacts via split-spoon. Depths selected for sampling were as follows: 22, 26, 28, 30, and 32 ft bgs. Samples were submitted to Pace for analysis of TPH separated by carbon number into the gasoline, diesel, and heavier ranges for crude oil. The boring ID assigned to this location was AOI8-BH-22-05.

2.2.2.6 N-170

On January 27, 2022, monitoring well N-170 was installed within five feet of OIHPT-UV boring AOI8-OIP-23 via PWI truck-mounted hollow-stem auger drill rig. Per the AOI8-OIP-23 Direct Image® electronic boring log results, a 10-foot section of 1-inch diameter, 0.01-inch slot PVC prepack screen was installed between 25 to 35 ft bgs to capture the peak interval of fluorescence observed between 29 and 35 ft bgs. The monitoring well was finished at ground surface with a 6-inch diameter flush-mounted cover and concrete pad.

Soil was continuously logged and sampled at pre-determined intervals via split-spoon. Depths selected for sampling were as follows: 23, 29, 31, 33, and 35 ft bgs. Samples were submitted to Pace for analysis of TPH separated by carbon number into the gasoline, diesel, and heavier ranges for crude oil. The boring ID assigned to this location was AOI8-BH-22-06.

2.2.3 SOIL DELINEATION SAMPLING

To collect concentration data for constituents of concern (COCs) in soil where impacts were observed in the unsaturated zone, soil delineation sampling was conducted. On May 19, 2022, Stantec remobilized to the Ball Field to oversee the advancement of three soil borings, AOI8-BH-22-10, AOI8-BH-22-09, and AOI8-BH-22-08 offset from OIHPT-UV borings AOI8-OIP-06, AOI8-OIP-07, and AOI8-OIP-04, respectively. The original OIHPT-UV boring locations were inaccessible due to the presence of a stormwater swale running parallel to the Philadelphia Water Department (PWD) sewer; therefore, the soil borings were offset approximately 15 feet to the east of each OIHPT-UV boring. A Stantec geologist estimated an elevation difference of one to three feet between the ground surface of the bottom of the swale where the OIHPT-UV borings were originally advanced in comparison the ground surface of the top of the swale where the offset soil borings were installed.

During Geoprobe® Direct Image® boring activities conducted in December 2021, fluorescence was observed above the water table in the 5 to 13 ft bgs interval in OIHPT-UV boring AOI8-OIP-04 near the western facility boundary. The nearest OIHPT-UV borings to the north (AOI8-OIP-06) and south (AOI8-OIP-07) did not exhibit fluorescence in this depth interval; therefore, to characterize and delineate the impacts

observed in OIHPT-UV boring AOI8-OIP-04 within the former Philadelphia Refinery boundaries, one soil boring was advanced, and one soil sample was collected near each of the three OIHPT-UV boring locations in the unsaturated zone.

Soil was continuously logged and screened in split-spoons with a PID by a Stantec geologist, and borings were advanced by TQD using a truck-mounted hollow stem auger drill rig to approximately 15 ft bgs at each boring location. Sample depth was initially planned to be biased based on visual (staining) or PID impacts, though no impacts were noted in any of the split-spoons during drilling. Instead, the Geoprobe® Direct Image® electronic boring log results for AOI8-OIP-04 guided the sampling depth in the absence of observable impacts. To account for the elevation difference between the original OIHPT-UV borings and the offset soil boring locations, samples were collected at a depth of 6 to 8 ft bgs to capture the fluorescence observed in the 5 to 7 ft bgs interval at AOI8-OIP-04.

Samples were submitted to SGS North America Inc. (SGS) for analysis of Evergreen Petroleum Short List compounds. The analytical laboratory report is in **Attachment D** and a detailed discussion and interpretation of results is in **Section 4.** Soil boring locations are depicted on **Figure 3**, and soil analytical results are summarized on **Table 3**. Soil results are screened against the PADEP soil to groundwater (S to GW) Medium Specific Concentrations (MSCs) and the non-residential direct contact (NRDC) MSCs.

2.3 Groundwater Sampling and Gauging

Groundwater sampling and gauging activities were conducted in the Ball Field between 2020 and 2022 in accordance with the *Evergreen Field Operations Manual* provided in **Attachment E**. Low-flow sampling methodology was employed, and purge water was field filtered through granular activated carbon (GAC) onto the ground surface via submersible pump or 0.85-inch diameter bladder pump for smaller (1-inch diameter) wells and wells with measurable product (sub-LNAPL sampling). A multi-parameter sonde with flow cell was utilized to collect field parameters during purging and until stabilization was achieved. Groundwater samples collected in April 2021 and April 2022 were analyzed for the following compounds (**Table 4**):

- Evergreen Petroleum Short List (with dissolved lead being field filtered)
- Tertiary butyl alcohol (TBA)
- Total inorganic carbon (TIC)
- Total organic carbon (TOC)
- Sulfate
- Dissolved headspace gases (methane, ethane, ethene)
- Total iron
- Total calcium
- Total Kjeldahl nitrogen (TKN)
- Alkalinity as $CaCO_3$

Samples were submitted to Pace, Eurofins Lancaster Laboratories Environmental (ELLE), or SGS for analysis. Groundwater samples collected subsequent and prior to the April 2021 and April 2022 sampling events were generally analyzed for a reduced list of compounds. Analytical results for the sampling events conducted in the Ball Field have been summarized in **Table 4** and exceedances of PADEP MSCs for non-

residential properties overlying used aquifers with total dissolved solids (TDS) less than or equal to 2,500 milligrams per liter (mg/L) are depicted on **Figure 2**.

Select groundwater samples were also analyzed as part of the forensics sampling program which will be described in further detail in **Section 3**. A more detailed discussion of groundwater analytical results in the context of delineation and petroleum sources can be found in **Section 4**.

According to liquid level measurements collected by Stantec in the Ball Field area since 2020, groundwater to flows generally to the southeast consistent with previous interpretations of groundwater flow in the area. **Figure 2** depicts groundwater elevation contours corresponding to a sitewide gauging event conducted in March 2022. Ball Field gauging records have been tabulated as **Table 5**.

2.3.1 N-163

Following installation of N-163 in December 2019, an initial round of groundwater sampling was performed by Aquaterra in February 2020. The sample was analyzed for Evergreen Petroleum Short List VOCs and results indicated benzene above the MSC of 5 micrograms per liter (µg/L) at a concentration of 398 µg/L and low levels of other VOCs. Two groundwater sampling events conducted by Stantec in September 2020 and December 2020 showed similarly elevated concentrations of benzene and low levels of other VOCs and semi-volatile organic compounds (SVOCs). Concentrations of benzene in the two most recent groundwater sampling events conducted in April 2021 and April 2022, while still exceeding the PADEP MSC of 5 µg/L, appear to be on a decline.

A groundwater sample was collected on March 16, 2021, for forensics analysis. This sample was submitted to Alpha Analytical Inc. (Alpha) of Westboro, Massachusetts for analysis of paraffins, isoparaffins, aromatics, naphthenes and olefins (PIANO) VOCs; TPH-ORO; tetraethyllead (TEL); tetramethyllead (TML); and ethanol. These results are discussed in **Section 3**.

Eight rounds of liquid level data were collected at N-163 since February 2020. Corrected groundwater elevation (CGWE) ranges from 9.5 to 7.3 ft relative to the North American Vertical Datum of 1988 (NAVD88). LNAPL has not been detected in this well.

2.3.2 N-164

An initial round of groundwater sampling was conducted at N-164 by Stantec in April 2021. Groundwater was sampled below the LNAPL (sub-LNAPL) to mitigate entrainment of free-phase petroleum into the samples. Exceedances of relevant PADEP MSCs were noted for benzene (2,700 µg/L), benzo(a)pyrene (0.33 µg/L), and naphthalene (290 µg/L) during the initial sampling event. Two subsequent groundwater sampling events conducted by Stantec in February and April 2022 indicated similar results, though benzo(a)pyrene was not detected (ND) in both samples.

Six rounds of liquid level data were collected at N-164 since April 2021. Apparent LNAPL thickness ranges from 0.13 to 0.37 ft, and CGWE ranges from 9.8 to 7.5 ft NAVD88.

2.3.3 N-165

Two rounds of groundwater sampling were conducted at N-165 by Stantec in February and April 2022. Benzene exceeded the PADEP MSC of 5 µg/L during both events; however, no other MSC exceedances were noted.

Three rounds of liquid level data were collected at N-165 since February 2022. CGWE ranges from 8.1 to 7.3 ft NAVD88. LNAPL was detected on February 17, 2022, with an apparent thickness of 0.01 ft, but has not been detected since.

2.3.4 N-166

Two rounds of groundwater sampling were conducted at N-166 by Stantec in February and April 2022. Benzene exceeded the PADEP MSC of 5 µg/L during both events. Benzo(a)pyrene (0.791 µg/L) and benzo(g,h,i)perylene (0.566 µg/L) exceeded their respective PADEP MSCs in February 2022 but were below MSCs during the April 2022 groundwater sampling event. No other exceedances were noted.

Three rounds of liquid level data were collected at N-166 since February 2022. CGWE ranges from 7.7 to 7.1 ft NAVD88. LNAPL has not been detected at this well.

2.3.5 N-167

Two rounds of groundwater sampling were conducted at N-167 by Stantec in February and April 2022. Lead (11.7 µg/L) exceeded the PADEP MSC of 5 µg/L in April 2022. No other exceedances were noted.

Three rounds of liquid level data were collected at N-167 since February 2022 CGWE ranges from 8.2 to 7.5 ft NAVD88. LNAPL has not been detected at this well.

2.3.6 N-168

Two rounds of groundwater sampling were conducted at N-168 by Stantec in February and April 2022. Benzo(a)pyrene (0.295 µg/L) and benzo(g,h,i)perylene (0.274 µg/L) exceeded their respective PADEP MSCs in February 2022; however these analytes were detected in the laboratory's method blank. Both compounds were below MSCs during the April 2022 groundwater sampling event.

Three rounds of liquid level data were collected at N-168 since February 2022. CGWE ranges from 8.7 to 7.7 ft NAVD88. LNAPL has not been detected at this well.

2.3.7 N-169

Two rounds of groundwater sampling were conducted at N-169 by Stantec in February and April 2022. Benzene exceeded the PADEP MSC of 5 µg/L during both events. Results were similar in the duplicate sample collected in April 2022. No other exceedances were noted.

Three rounds of liquid level data have been collected at N-169 since February 2022. CGWE ranges from 8.3 to 7.4 ft NAVD88. LNAPL has not been detected at this well with the exception of a single observation of product on an interface probe in February 2022.

2.3.8 N-170

Two rounds of sub-LNAPL groundwater sampling were conducted at N-170 by Stantec in February and April 2022. Benzene exceeded the PADEP MSC of 5 µg/L during both events. Benzo(a)pyrene (0.937 µg/L) and benzo(g,h,i)perylene (0.926 µg/L) exceeded their respective PADEP MSCs in April 2022. No other exceedances were noted.

Three rounds of liquid level data were collected at N-170 since February 2022. Apparent LNAPL thickness ranges from 0.02 to 0.60 ft, and CGWE ranges from 8.2 to 7.4 ft NAVD88.

3 Forensics Program

An environmental forensics sampling program was completed to bolster the routine chemistry data with a comprehensive characterization and statistical analysis of chemical compositional patterns exploring various sample media to support the characterization and delineation of AOI 8 Ball Field contaminant sources. Compound-specific isotope analysis (CSIA) samples were collected to support the environmental forensics lines of information by investigating forensic differences in stable isotope chemistry of groundwater samples.

3.1 Sucralose Sampling

In 2021 and 2022, select monitoring wells in proximity to City of Philadelphia combined sewers were sampled for sucralose as a line of information supporting groundwater and sewage interactions (sewer leaks). Groundwater samples collected at N-163 and N-164 were submitted to the Environmental Analysis Research Laboratory (EARL) Southeast Environmental Research Center at Florida International University of Miami, Florida for sucralose analysis in April 2021. Five additional Ball Field area samples (N-163, N-164, N-166, N-168, and N-169) were submitted to EARL for sucralose analysis in April 2022, and those results are included in Part 2 of the Sitewide Fate and Transport RIR. Sucralose 2021 results are included in **Table 3**.

3.2 Molecular Data Exploration and Interpretive Reporting

ChemQuants was retained by Stantec on behalf of Evergreen to perform an environmental forensics investigation in support of the AOI 8 Ball Field area investigation. The initial objective was to fingerprint selected samples from the drilling program to explore the various sources identified in initial CSIA samples, establish or refute a potential relationship with Maiden Lane area contamination sources, and where possible, to age-constrain the timing of petroleum releases.

In the AOI 8 Ball Field area, the following samples were collected for forensic analysis:

- N-163 (groundwater)
- N-164 (soil)
- N-161 (product)
- N-161 (groundwater)

Attachment F includes ChemQuants reports that describe basic forensics interpretations for these samples. The Sitewide Fate and Transport RIR, to which this memo is an appendix, includes as another attachment, interpretive reporting of these data prepared by ChemQuants. **Section 4.4** includes some discussion of the results.

3.3 CSIA Petroleum Source Implications and Biodegradation

CSIA is a powerful forensics tool that complements environmental forensics as an additional line of information regarding differentiation of sources, extent of biodegradation, and biodegradation pathways which often associate with other pathways of groundwater flow. Stantec retained MES, LLC (MES) on behalf of Evergreen to interpret the CSIA dataset and provide expertise in geochemistry on the project.

In the AOI 8 Ball Field area, the following groundwater samples were collected for CSIA analysis:

- N-161
- N-163

The Sitewide Fate and Transport RIR, to which this memo is an appendix, includes as another attachment, interpretive reporting of these data prepared by MES. **Section 4.4** includes some discussion of the results.

4 Discussion of Results and Conceptual Site Model Update

The information discussed in this section is intended to be an update to the data analysis included in the 2017 AOI 8 RIR.

4.1 Constituents of Concern

4.1.1 SOIL

- Soil sampling for the Evergreen Petroleum Short List was targeted at the location where fluorescence was observed in the unsaturated zone (AOI8-OIP-04) with the intention of collecting analytical data to characterize any onsite petroleum sources in the area and delineate them according to the selected standard.

- One sample was collected in the boring adjacent to AOI8-OIP-04, and one sample was collected from each adjacent location to the north and south. These three samples were collected from the approximate depth of observed fluorescence in AOI8-OIP-04.

- In the sampling event, concentrations of 5 SVOCs and lead were detected above the S to GW MSC, but no concentrations of COCs were detected above the NRDC MSCs.
- No volatile organic compounds (VOCS) were detected in the soil samples.

4.1.2 GROUNDWATER

- Benzene is observed in the AOI 8 PES Ball Field area at concentrations above the SHS, with the highest concentrations detected in groundwater samples collected from below LNAPL in N-164.
- SVOCs benzo(a)pyrene and benzo(g,h,i)perylene were detected at concentrations above their respective SHS in three wells.
- Naphthalene was detected above the SHS in N-164 from groundwater samples collected from below LNAPL.
- Lead was detected in N-167 at a concentration above the SHS in one of the two sampling events.

The additional investigation work confirmed groundwater flow direction to the southeast in the AOI 8 PES Ball Field area therefore delineating the downgradient impacts to the former Philadelphia Refinery.

4.2 Potential Migration Pathways and Receptors

- Access to AOI 8 is restricted by fencing and security measures. HRP is responsible for overall security and oversight of contractor safety including implementation of PPE and work plan/permitting protocols that mitigate the potential for worker exposure to impacted soil, groundwater, and/or LNAPL through the direct contact pathway. Exceedances of the NRDC MSC were ND in soil samples collected during this investigation.
- Downgradient concentrations of benzene in groundwater exceeding the SHS are delineated within the former Philadelphia Refinery. The vertical proximity distance for petroleum compounds in groundwater is 5 ft. In this area, groundwater is present deeper than this vertical proximity distance, indicating that volatilization of VOCs from groundwater is not of concern in this area.
- PWD sewers, which could serve as a preferential pathway for vapor intrusion, are present in this area. A sitewide evaluation of preferential pathways for vapor intrusion is planned as a part of a future Act 2 deliverable.

4.3 Data Analysis/Summary of Investigation Findings

- A new monitoring well (N-163) was installed adjacent to existing well N-100 in 2019 and screened discretely to target an apparent petroleum impacted zone recognized on the N-100 well log. The impacted zone was just below the N-100 screen setting in an approximately 10-foot-thick sand and gravel layer. Groundwater sampling of N-163 indicated that petroleum hydrocarbon impacts were present.

Reference: AOI 8 Ball Field Site Characterization/Investigation Activities, 2019-2022, Former Philadelphia Refinery, 3144 Passyunk Avenue, Philadelphia, PA

- An additional monitoring well, N-164, was installed in 2021 to delineate the petroleum hydrocarbon impacts observed at N-163 in a direction that would be plausible if there were to be a groundwater flow path towards the Schuylkill River. Petroleum impacts were observed during the installation of N-164 and were found to be more elevated compared to N-163. Additionally, LNAPL was observed in the well during gauging activities.

- In early 2021, preliminary forensics of the LNAPL in soil at N-164, groundwater at N-163, groundwater at N-161, and product at N-161 indicated that the area was impacted by gasoline to naphtha range petroleum.

- In September 2021, CSIA was performed on groundwater samples from N-161 and N-163 to add another line of evidence to support source relationships. It was found that the two wells likely have different benzene sources. As explained in the AOI 4 RIR Addendum, well N-161 appears to share a common benzene source with well S-378, located on South 26th Street near Penrose Avenue. Moreover, while well N-163 appears to have a different benzene source, a biomarker naphthene compound methylcyclohexane found in the groundwater appears to have a common source to wells near Hartranft Street and well S-378. These data suggest a City sewer transport pathway as a likely source to the AOI 8 Ball Field and Maiden Lane area. These data are additionally discussed in the CSIA report appendix to the Sitewide Fate and Transport RIR.

- In 2021, groundwater samples were collected from wells N-161, N-163, N-164, N-3, V-MW-2, and N-157 for sucralose analysis and results documented in the AOI 4 RIR Addendum forensics reporting. One of the highest sucralose concentrations reported for the 65 sitewide wells sampled was for well N-161, and sucralose was also detected in N-163, N-157, and V-MW-2. These data support the sewer transport pathway to the area.

- Complexity of the AOI 8 Ball Field conditions warranted a HRSC which commenced in December 2021. Twenty-nine direct push soil borings were advanced to depths up to approximately 40 ft bgs using Geoprobe® Direct Image® ultraviolet-range optical image profiler and hydraulic profiling tools (combination OIHPT-UV setup). Fuel fluorescence data in combination with permeability data and electrical conductivity indicated that the primary LNAPL zone impacting wells N-163 and N-164 is confined below shallow mud deposits of the Pleistocene alluvium and a deeper clay deposit. Through confirmation coring at select locations, the deeper clay deposit appears consistent with an aquitard of the Potomac-Raritan-Magothy (PRM) sequence, likely the middle clay near its up-dip limit. This finding vertically delineates the AOI 8 Ball Field petroleum impacts to a confined zone of the water table.

- Twenty-seven soil samples were collected from confirmation cores at select borings to estimate the magnitude of LNAPL saturations present in the hydrocarbon impacted zones. Laboratory analysis for TPH in the gasoline, diesel, and oil ranges was performed. NAPL saturation estimates were calculated from the TPH data and indicated that residual saturations are present, from less than 1 percent to under 12 percent.

- Monitoring wells were installed at six of the boring locations and were used to evaluate groundwater flow patterns and characterize groundwater impacts from the residual LNAPL. Groundwater elevation data available to date support a southeasterly flow direction across the AOI 8 Ball Field with convergence in the general vicinity of the Maiden Lane sewer.

Reference: AOI 8 Ball Field Site Characterization/Investigation Activities, 2019-2022, Former Philadelphia Refinery, 3144 Passyunk Avenue, Philadelphia, PA

- Additional soil samples were collected in 2022 from targeted depths and borings along the western Ball Field perimeter to understand Short List compound concentrations in the fluorescence intervals in subsurface soil. No VOCs were detected, and SVOCs and lead detections were below the selected standard for subsurface soil at the facility.

Table 2: Soil Analytical Results Summary, TPH (2022)
Area of Interest 8 Ball Field
Philadelphia Refinery Operations, a series of Evergreen Resources Group, LLC

Notes:
NAPL Saturation = TPH x ((bulk density x 10^{-6}) / (porosity x LNAPL density))
bulk density = 1.7 g/cm^{3}
porosity = 0.35
LNAPL density = 0.81 g/cm^{3}
Above values are estimates. LNAPL density based on specific gravity of LNAPL measured at N-138 (primarily light and middle distillate).

ND (0.03)	indicates concentration not detected above the laboratory reporting limit (in parentheses).
J	indicates an estimated value
ft	feet
mg/kg	miligrams per kilogram
g/cm^{3}	grams per cubic centimeter
%	percent
TPH	total petroleum hydrocarbons
OIHPT-UV	Geoprobe® Direct Image® ultraviolet-range optical image profiler and hydraulic profiling tools
LNAPL	light nonaqueous phase liquid
NAPL	nonaqueous phase liquid

Notes:

MSC-PA	Pennsylvania Department of Environmental Protection (PADEP) - Medium Specific Concentrations
A	Medium Specific Concentrations (MSCs) for Organic/Inorganic Regulated Substances in Soil – Soil to Groundwater, Higher of the 100x the Groundwater MSC and the Generic Value (Unsaturated), Non-Residential
B	Medium-Specific Concentrations (MSCs) for Organic/Inorganic Regulated Substances in Soil – Direct Contact, Subsurface Soil (2-15 ft), Non-Residential
190[A]	Concentration exceeds standard A.
15.2	Measured concentration did not exceed the indicated standard.
ND (0.03)	Indicates concentration not detected above the laboratory reporting limit (in parentheses) except when the reporting limit is greater than the standard in which case the method detection limit is listed in parentheses.
J	Indicates an estimated value
mg/kg	milligrams per kilogram
ft	feet
SGSA	SGS North America Inc.
OIHPT-UV	Geoprobe® Direct Image® ultraviolet-range optical image profiler and hydraulic profiling tools

Table 4: Groundwater Analytical Results Summary (2020 - 2022)
Area of Interest 8 Ball Field
Philadelphia Refinery Operations, a series of Evergreen Resources Group, LLC

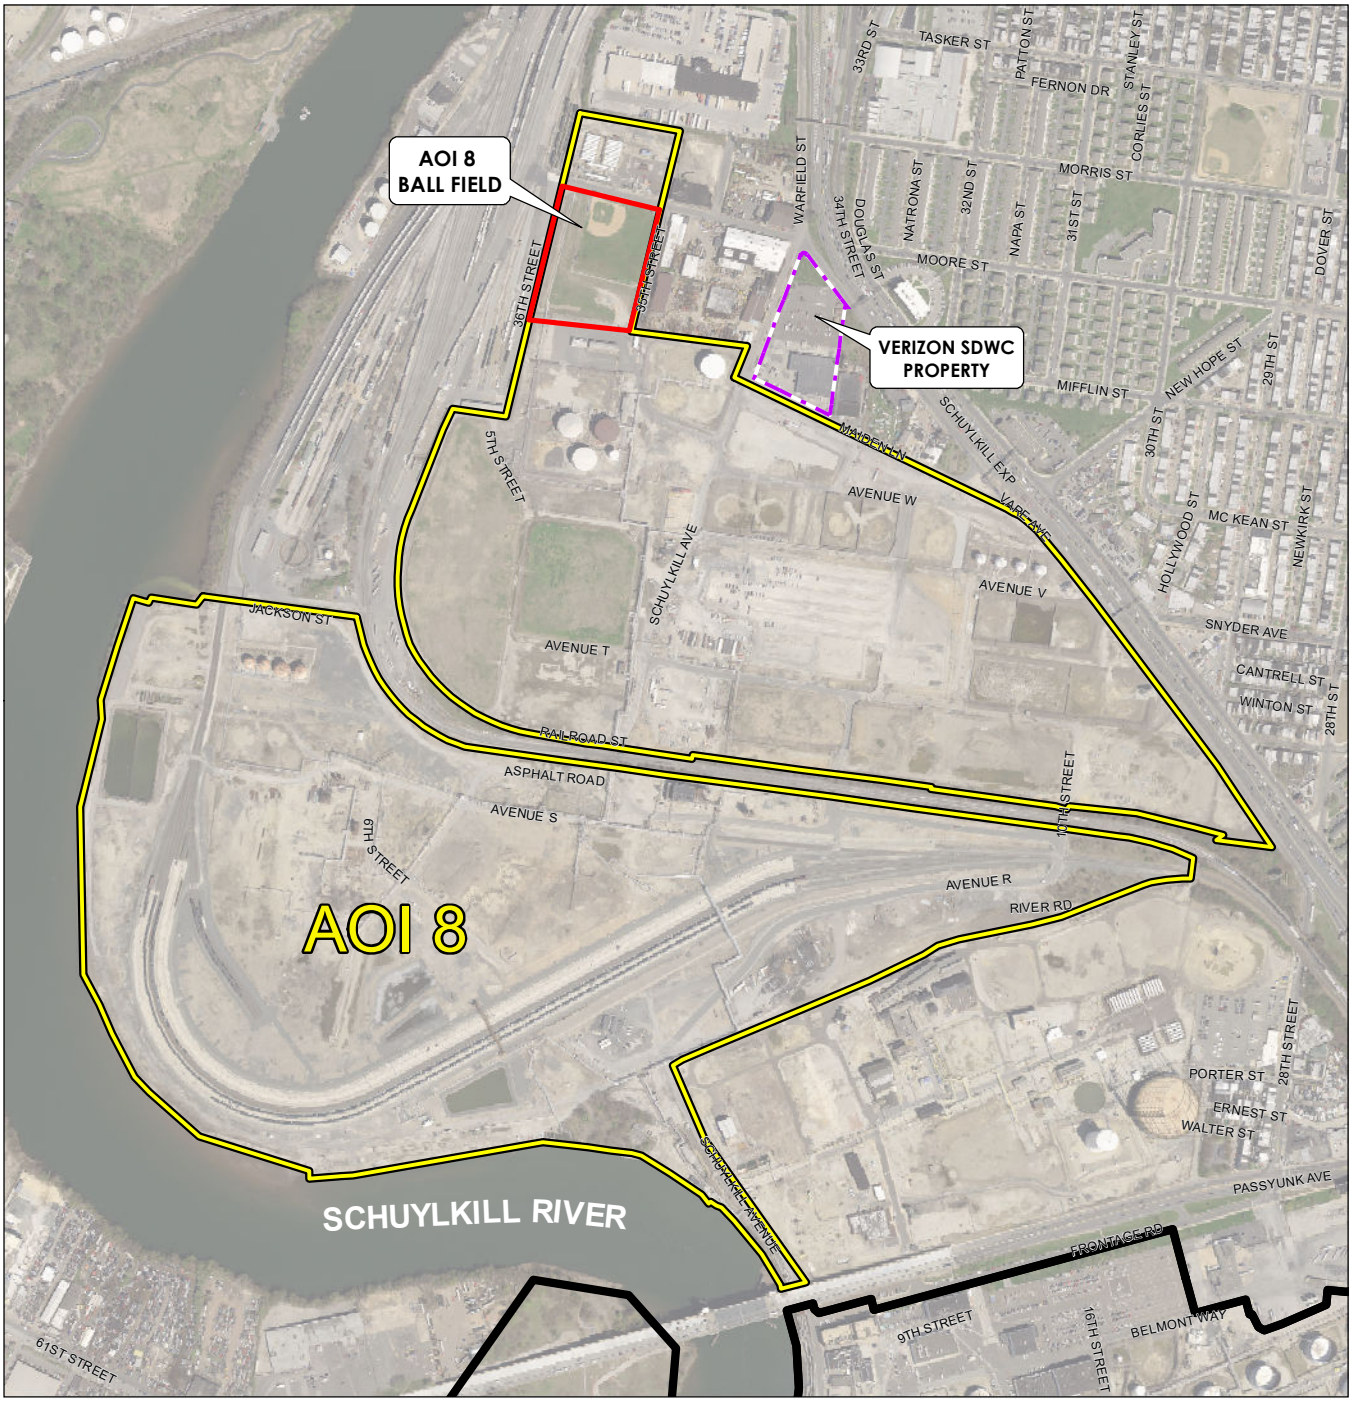
Notes:



MSC-PA	Pennsylvania Department of Environmental Protection (PADEP)
	Medium-Specific Concentrations (MSCs) for Organic/Inorganic Regulated Substances in Groundwater - Used Aquifer, Non Residential, TDS ≤ 2500
6.5	Concentration exceeds the indicated standard.
15.2	Measured concentration did not exceed the indicated standard.
ND (0.50)	Laboratory reporting limit was greater than the applicable standard.
ND (0.03)	Indicates concentration not detected above the laboratory reporting limit (in parentheses) except when the reporting limit is greater than the standard in which case the method detection limit is listed in parentheses.
n/v	No standard/guideline value
-	Parameter not analyzed / not available
B	Indicates the analyte is detected in the associated blank as well as in the sample.
J	Indicates an estimated value
SL	Sample was collected below LNAPL
µg/L	Micrograms per liter
EARL	Environmental Analysis Research Laboratory, Southeast Environmental Research Center, International University of Miami, Florida
SGSA	SGS North America, Inc.
PACE	Pace Analytical Services, LLC
LANCASTER	Eurofins Lancaster Laboratories Environmental

RE: Project: 213403364-Revised Report
Pace Project No.: 30460228

Dear Ms. Menges:

Enclosed are the analytical results for sample(s) received by the laboratory on January 20, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

(Greensburg, PA) - Revision 2 - This report replaces the May, 19, 2022 report. This project was revised on June, 07, 2022 to report C6-C10 only for GRO.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Courtney Fenk

PROJECT NARRATIVE

Project: 213403364-Revised Report
Pace Project No.: 30460228

Method: **EPA 8015D**
Description: 8015D TPH Microwave
Client: Sunoco_Stantec (West Chester)
Date: June 07, 2022

General Information:
8 samples were analyzed for EPA 8015D by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3546 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

QC Batch: 480583

S4: Surrogate recovery not evaluated against control limits due to sample dilution.

- AOI8-BH-22-01-24_20220118 (Lab ID: 30460228001)

QUALIFIERS

Project: 213403364-Revised Report
Pace Project No.: 30460228

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

E	Analyte concentration exceeded the calibration range. The reported result is estimated.
MH	Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.
S4	Surrogate recovery not evaluated against control limits due to sample dilution.
ST	Surrogate recovery was above laboratory control limits. Results may be biased high.

RE: Project: 213403364 / A018 Ballfield Con-Revised Report
Pace Project No.: 30461349

Dear Ms. Menges:

Enclosed are the analytical results for sample(s) received by the laboratory on January 28, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

(Greensburg, PA) - Revision 1 - This report replaces the February, 11, 2022 report. This project was revised on June, 07, 2022 to correct the sample IDs.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Courtney Fenk

PROJECT NARRATIVE

Project: 213403364 / A018 Ballfield Con-Revised Report
Pace Project No.: 30461349

Method: **EPA 8015D**
Description: 8015D TPH Microwave
Client: Sunoco_Stantec (West Chester)
Date: June 07, 2022

General Information:
19 samples were analyzed for EPA 8015D by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 3546 with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:
All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

QC Batch: 482316

A matrix spike and/or matrix spike duplicate (MS/MSD) were performed on the following sample(s): 30461349001

ML: Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.

- MS (Lab ID: 2331448)

PROJECT NARRATIVE

Project: 213403364 / A018 Ballfield Con-Revised Report
Pace Project No.: 30461349

Method: **EPA 8015D**
Description: 8015D GRO Soil
Client: Sunoco_Stantec (West Chester)
Date: June 07, 2022

General Information:
19 samples were analyzed for EPA 8015D by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Sample Preparation:
The samples were prepared in accordance with EPA 5035A/5030B with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Surrogates:
All surrogates were within QC limits with any exceptions noted below.

QC Batch: 481740

S4: Surrogate recovery not evaluated against control limits due to sample dilution.

QUALIFIERS

Project: 213403364 / A018 Ballfield Con-Revised Report
Pace Project No.: 30461349

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D6	The precision between the sample and sample duplicate exceeded laboratory control limits.
ML	Matrix spike recovery and/or matrix spike duplicate recovery was below laboratory control limits. Result may be biased low.
S4	Surrogate recovery not evaluated against control limits due to sample dilution.
SR	Surrogate recovery was below laboratory control limits. Results may be biased low.
ST	Surrogate recovery was above laboratory control limits. Results may be biased high.

Sample Receiving Non-Conformance Form (NCF)

Date: 1-28-22	**Evaluated by:** Shirley Andreason
Client: Stantec	

Affix Workorder/Login Label Here or List Pace Workorder Number or MTJL Log-in Number Here

1. If Chain-of-Custody (COC) is not received: contact client and if necessary, fill out a COC and indicate that it was filled out by lab personnel. Note issues on this NCF.

2. If COC is incomplete, check applicable issues below and add details where appropriate:

Collection date/time missing or incorrect	Analyses or analytes: missing or clarification needed	Samples listed on COC do not match samples received (missing, additional, etc.)
Sample IDs on COC do not match sample labels	Required trip blanks were not received	Required signatures are missing

Comments/Details/Other Issues not listed above:

3. Sample integrity issues: check applicable issues below and add details where appropriate:

Samples: Past holding time	Samples: Condition needs to be brought to lab personnel's attention (details below)	Preservation: Improper
Samples: Not field filtered	Containers: Broken or compromised	Temperature: not within acceptance criteria (typically 0-6C)
Samples: Insufficient volume received	Containers: Incorrect	Temperature: Samples arrived frozen
Samples: Cooler damaged or compromised	Custody Seals: Missing or compromised on samples, trip blanks or coolers	Vials received with improper headspace
Samples: contain chlorine or sulfides	Packing Material: Insufficient/Improper	✓ Other:

Comments/Details:

no container preservative type on COC
no dry weight received for A018-BH-22-03-31-20220125 (004)

4. If Samples not preserved properly and Sample Receiving adjusts pH, add details below:

Sample ID:	Date/Time:	Amount/type pres added:
Preserved by:	Initial and Final pH:	Lot # of pres added:
Sample ID:	Date/Time:	Amount/type pres added:
Preserved by:	Initial and Final pH:	Lot # of pres added:
Sample ID:	Date/Time:	Amount/type pres added:

RE: SGS – Dayton, Job # JD40284 - Reissues

Dear Ms. Menges,

The final report for SGS job number JD40284 has been edited to reflect corrections to the results. These edits have been incorporated into the revised report which is attached.

Specifically, the Naphthalene has been omitted from volatile samples and retrieved from SIM samples per client's request. The attached revised report incorporates these revisions.

SGS apologizes for this occurrence and for any inconvenience this situation may have caused. Please contact me if I can be of further assistance in this matter.

Sincerely,

Report Department

SGS North America Inc.

(a) Outside of in house control limits, but within reasonable method recovery limits.

ND = Not detected MDL = Method Detection Limit
RL = Reporting Limit
E = Indicates value exceeds calibration range
J = Indicates an estimated value
B = Indicates analyte found in associated method blank
N = Indicates presumptive evidence of a compound

Parameter Certification Exceptions

Job Number: JD40284
Account: SUNOCOSS Sunoco/Evergreen
Project: SECORPAE:Former Philadelphia Refinery, 3144 Passyunk Avenue, Philadelphia, PA

The following parameters included in this report are exceptions to NELAC certification.
The certification status of each is indicated below.

Parameter	CAS#	Method	Mat	Certification Status
Inorganic Carbon		**SM5310 B-11**	AQ	SGS is not certified for this parameter.[a]

(a) Lab cert for analyte not supported by NJDEP, OQA. Only methods/analytes required for reporting by the State of NJ can be certified in NJ. Use of this analyte for compliance must be verified through the appropriate regulatory office.

Certification exceptions shown are based on the New Jersey DEP certifications. Applicability in other states may vary. Please contact your laboratory representative if additional information is required for a specific regulatory program.

RE: SGS – Dayton, Job # JD40008 - Reissues

Dear Ms. Menges,

The final report for SGS job number JD40008 has been edited to reflect corrections to the results. These edits have been incorporated into the revised report which is attached.

Specifically, the Naphthalene has been reported for volatile samples per request. The attached revised report incorporates these revisions.

SGS apologizes for this occurrence and for any inconvenience this situation may have caused. Please contact me if I can be of further assistance in this matter.

Sincerely,

Report Department

SGS North America Inc.

CASE NARRATIVE / CONFORMANCE SUMMARY

Client: Sunoco/Evergreen **Job No:** JD40008

Site: SECORPAE:Former Philadelphia Refinery, 3144 Passyunk Avenue, **Report Date** 6/9/2022 5:35:40 PM

On 02/18/2022, 4 Sample(s), 1 Trip Blank(s) and 0 Field Blank(s) were received at SGS North America Inc. at a maximum corrected temperature of 1.2 C. Samples were intact and chemically preserved, unless noted below. A SGS North America Inc. Job Number of JD40008 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Compounds qualified as out of range in the continuing calibration summary report are acceptable as per method requirements when there is a high bias but the sample result is non-detect.

MS Volatiles By Method SW846 8260D

Matrix: AQ **Batch ID:** V2C8406

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD40038-3MS, JD40038-3MSD were used as the QC samples indicated.
- JD40008-2: Dilution required due to high concentraton of non-target compound.

Matrix: AQ **Batch ID:** V4D5151

- All samples were analyzed within the recommended method holding time.
- Sample(s) JD39923-9MS, JD39923-9MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- Matrix Spike Duplicate Recovery(s) for 1,2-Dichloroethane are outside control limits. Probable cause due to matrix interference.
- Matrix Spike Recovery(s) for Benzene are outside control limits. Outside control limits due to high level in sample relative to spike amount.

MS Semi-volatiles By Method SW846 8270E BY SIM

Matrix: AQ **Batch ID:** OP38283

- All samples were extracted within the recommended method holding time.
- Sample(s) JD40008-1, JD40008-3 have compounds reported with "E" qualifiers indicating estimated value exceeding calibration range.
- Sample(s) JD40008-1, JD40008-2, JD40008-3, JD40008-4 have compound(s) reported with a "B" qualifier, indicating analyte is found in the associated method blank.
- OP38283-BSD: Recovery indicates possible low bias. Since balnk spike recoveries are within control limits, data are qualified and reported.
- OP38283-BSD for Anthracene: Analytical precision exceeds in-house control limits.

GC Volatiles By Method RSK-175

Matrix: AQ **Batch ID:** GAA2502

- All samples were analyzed within the recommended method holding time.
- Sample(s) JD39963-3DUP were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- RPD(s) for Duplicate for Ethane, Ethene are outside control limits for sample JD39963-3DUP. Probable cause due to sample homogeneity.

GC Volatiles By Method SW846-8011

Matrix: AQ **Batch ID:** OP38248

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD39951-1MS, JD39951-2DUP were used as the QC samples indicated.
- JD40008-3 for 1,2-Dibromoethane: Associated CCV outside of control limits high, sample was ND.
- JD40008-4 for 1,2-Dibromoethane: Associated CCV outside of control limits high, sample was ND.
- JD40008-2 for 1,2-Dibromoethane: Associated CCV outside of control limits high, sample was ND.
- JD40008-1 for 1,2-Dibromoethane: Associated CCV outside of control limits high, sample was ND.

Metals Analysis By Method SW846 6010D

Matrix: AQ **Batch ID:** MP31401

- All samples were digested within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD40008-4MS, JD40008-4MSD, JD40008-4SDL were used as the QC samples for metals.

Metals Analysis By Method SW846 6020B

Matrix: AQ **Batch ID:** MP31402

- All samples were digested within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD40008-3FMS, JD40008-3FMSD, JD40008-3FSDL were used as the QC samples for metals.

General Chemistry By Method EPA 300/SW846 9056A

Matrix: AQ **Batch ID:** GP38640

- All samples were prepared within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD39964-10DUP, JD39964-10MS were used as the QC samples for Sulfate.

General Chemistry By Method EPA 351.2/LACHAT

Matrix: AQ **Batch ID:** GP38657

- All samples were prepared within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD40008-3DUP, JD40008-3MS were used as the QC samples for Nitrogen, Total Kjeldahl.

General Chemistry By Method SM2320 B-11

Matrix: AQ **Batch ID:** GN26594

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD39850-2DUP were used as the QC samples for Alkalinity, Total as CaCO3.
- JD40008-3 for Alkalinity, Total as CaCO3: Sample was titrated to a final pH of 4.5.
- JD40008-2 for Alkalinity, Total as CaCO3: Sample was titrated to a final pH of 4.5.
- JD40008-1 for Alkalinity, Total as CaCO3: Sample was titrated to a final pH of 4.5.

Matrix: AQ **Batch ID:** GN26627

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD40035-1DUP were used as the QC samples for Alkalinity, Total as CaCO3.
- JD40008-4 for Alkalinity, Total as CaCO3: Sample was titrated to a final pH of 4.5.Sample receieved with head space.Net alkalinity ___mg/L

General Chemistry By Method SM5310 B-11

Matrix: AQ **Batch ID:** GP38634

- All samples were prepared within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD39968-1MS, JD39968-1MSD were used as the QC samples for Total Organic Carbon.

Matrix: AQ **Batch ID:** GP38635

- All samples were prepared within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD40008-1MS, JD40008-1MSD were used as the QC samples for Total Carbon.
- JD40008-4 for Total Carbon: Elevated detection limit due to dilution required for matrix interference.
- JD40008-1 for Total Carbon: Elevated detection limit due to dilution required for matrix interference.
- JD40008-2 for Total Carbon: Elevated detection limit due to dilution required for matrix interference.
- JD40008-3 for Total Carbon: Elevated detection limit due to dilution required for matrix interference.

Matrix: AQ **Batch ID:** R195802

- The data for SM5310 B-11 meets quality control requirements.
- JD40008-1 for Inorganic Carbon: Calculated as: Total Carbon - Total Organic Carbon

Matrix: AQ **Batch ID:** R195803

- The data for SM5310 B-11 meets quality control requirements.
- JD40008-2 for Inorganic Carbon: Calculated as: Total Carbon - Total Organic Carbon

Matrix: AQ **Batch ID:** R195804

- The data for SM5310 B-11 meets quality control requirements.
- JD40008-3 for Inorganic Carbon: Calculated as: Total Carbon - Total Organic Carbon

Matrix: AQ **Batch ID:** R195805

- The data for SM5310 B-11 meets quality control requirements.
- JD40008-4 for Inorganic Carbon: Calculated as: Total Carbon - Total Organic Carbon

SGS North America Inc. certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

SGS North America Inc. is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by SGS North America Inc indicated via signature on the report cover

Project:	SECORPAE:Former Philadelphia Refinery, 3144 Passyunk Avenue, Philadelphia, PA		

General Chemistry

Analyte	Result	RL	Units	DF	Analyzed	By	Method
Alkalinity, Total as CaCO3 [a]	533	5.0	mg/l	1	02/22/22 13:45	MP	SM2320 B-11
Inorganic Carbon [b]	108	6.0	mg/l	1	02/22/22 17:19	NA	SM5310 B-11
Nitrogen, Total Kjeldahl	0.60	0.20	mg/l	1	02/24/22 15:52	MM	EPA 351.2/LACHAT
Sulfate	163	2.0	mg/l	1	02/22/22 11:12	JD	EPA 300/SW846 9056A
Total Carbon [c]	114	5.0	mg/l	5	02/22/22 17:19	NA	SM5310 B-11
Total Organic Carbon	6.3	1.0	mg/l	1	02/22/22 14:38	NA	SM5310 B-11

(a) Sample was titrated to a final pH of 4.5.Sample receieved with head space.Net alkalinity ___mg/L
(b) Calculated as: Total Carbon - Total Organic Carbon
(c) Elevated detection limit due to dilution required for matrix interference.

Parameter Certification Exceptions

Job Number: JD40008
Account: SUNOCOSS Sunoco/Evergreen
Project: SECORPAE:Former Philadelphia Refinery, 3144 Passyunk Avenue, Philadelphia, PA

The following parameters included in this report are exceptions to NELAC certification.
The certification status of each is indicated below.

Parameter	CAS#	Method	Mat	Certification Status
Inorganic Carbon		**SM5310 B-11**	AQ	SGS is not certified for this parameter.[a]

(a) Lab cert for analyte not supported by NJDEP, OQA. Only methods/analytes required for reporting by the State of NJ can be certified in NJ. Use of this analyte for compliance must be verified through the appropriate regulatory office.

Certification exceptions shown are based on the New Jersey DEP certifications. Applicability in other states may vary. Please contact your laboratory representative if additional information is required for a specific regulatory program.

Instrument ID: GCMS4D
Injection Date: 02/22/22
Injection Time: 21:59

m/e	Ion Abundance Criteria	Raw Abundance	% Relative Abundance		Pass/Fail
50	14.99 - 40.0% of mass 95	29669	21.6		Pass
75	30.0 - 60.0% of mass 95	65357	47.6		Pass
95	Base peak, 100% relative abundance	137349	100.0		Pass
96	5.0 - 9.0% of mass 95	8987	6.54		Pass
173	Less than 2.0% of mass 174	0	0.00	(0.00) [a]	Pass
174	50.0 - 120.0% of mass 95	119499	87.0		Pass
175	5.0 - 9.0% of mass 174	9287	6.76	(7.77) [a]	Pass
176	95.0 - 101.0% of mass 174	117123	85.3	(98.0) [a]	Pass
177	5.0 - 9.0% of mass 176	7504	5.46	(6.41) [b]	Pass

(a) Value is % of mass 174
(b) Value is % of mass 176

This check applies to the following Samples, MS, MSD, Blanks, and Standards:

IS 1 = 1-Methylnaphthalene-d10
IS 2 = Fluorene-d10
IS 3 = Fluoranthene-d10
IS 4 = Benzo(a)pyrene-d12

(a) Upper Limit = + 100% of check standard area; Retention time + 0.5 minutes.
(b) Lower Limit = -50% of check standard area; Retention time -0.5 minutes.
(c) Recovery indicates possible low bias. Since balnk spike recoveries are within control limits, data are qualified and reported.
(d) Internal standard failing low.

Definitions,

Molar Volume	**The volume of 1 mole of any gas at standard temperature and pressure(STP)**
Water g/Moles	**1 Liter of water is equal to 55.5g-moles**
Temp-kelvin	**Is defined as 273 + degress C**
Corrected Gas Density	**Gas density corrected for temperature is equal to (molar volume) x (temp-k/273)**
Headspace conc(ug/l)	**Is equal to (ppmv reading) x (mw/corrected gas density)**
Water Concentration(ug/l)	**Is equal to headspace conc(ug/l) x headspace vol/sample vol**
Saturation Concentration(ug/l)	**Gas which remains at equilibrium in the sample is equal to (headspace conc-ppm) x (mw) x (55.5)/(Henry's Constant)**

Definitions,

Molar Volume	**The volume of 1 mole of any gas at standard temperature and pressure(STP)**
Water g/Moles	**1 Liter of water is equal to 55.5g-moles**
Temp-kelvin	**Is defined as 273 + degress C**
Corrected Gas Density	**Gas density corrected for temperature is equal to (molar volume) x (temp-k/273)**
Headspace conc(ug/l)	**Is equal to (ppmv reading) x (mw/corrected gas density)**
Water Concentration(ug/l)	**Is equal to headspace conc(ug/l) x headspace vol/sample vol**
Saturation Concentration(ug/l)	**Gas which remains at equilibrium in the sample is equal to (headspace conc-ppm) x (mw) x (55.5)/(Henry's Constant)**

*** ppmv is corrected for helium blank background peak area**

Definitions,

Molar Volume	**The volume of 1 mole of any gas at standard temperature and pressure(STP)**
Water g/Moles	**1 Liter of water is equal to 55.5g-moles**
Temp-kelvin	**Is defined as 273 + degress C**
Corrected Gas Density	**Gas density corrected for temperature is equal to (molar volume) x (temp-k/273)**
Headspace conc(ug/l)	**Is equal to (ppmv reading) x (mw/corrected gas density)**
Water Concentration(ug/l)	**Is equal to headspace conc(ug/l) x headspace vol/sample vol**
Saturation Concentration(ug/l)	**Gas which remains at equilibrium in the sample is equal to (headspace conc-ppm) x (mw) x (55.5)/(Henry's Constant)**

*** ppmv is corrected for helium blank background peak area**

Definitions,

Molar Volume	**The volume of 1 mole of any gas at standard temperature and pressure(STP)**
Water g/Moles	**1 Liter of water is equal to 55.5g-moles**
Temp-kelvin	**Is defined as 273 + degress C**
Corrected Gas Density	**Gas density corrected for temperature is equal to (molar volume) x (temp-k/273)**
Headspace conc(ug/l)	**Is equal to (ppmv reading) x (mw/corrected gas density)**
Water Concentration(ug/l)	**Is equal to headspace conc(ug/l) x headspace vol/sample vol**
Saturation Concentration(ug/l)	**Gas which remains at equilibrium in the sample is equal to (headspace conc-ppm) x (mw) x (55.5)/(Henry's Constant)**

Henry's Constants

SGS – Dayton, Job # JD43215-Reissue

Dear Ms. Menges,

The final report for SGS job number JD43215 has been edited to reflect corrections to the final results. These edits have been incorporated into the revised report which is attached.

Specifically, the COMS, NIMS,VMS,ZNMS were retrieved in sample JD43215-2F per your request on 4/27/2022. The attached revised report incorporates these revisions.

SGS apologizes for this occurrence and for any inconvenience this situation may have caused. Please contact me if I can be of further assistance in this matter.

Sincerely,

Report Department

SGS North America Inc.

CONTINUOUS SERVICE IMPROVEMENT!

Our goal is to continuously improve our service to you. Please share your ideas about how we can serve you better at EHS.US.CustomerCare@sgs.com. Your feedback is appreciated!

CASE NARRATIVE / CONFORMANCE SUMMARY

Client:	Sunoco/Evergreen	**Job No**	JD43215
Site:	SECORPAE:Former Philadelphia Refinery, 3144 Passyunk Avenue,	**Report Date**	5/6/2022 2:30:44 PM

On 04/15/2022, 26 Sample(s), 1 Trip Blank(s) and 0 Field Blank(s) were received at SGS North America Inc. at a maximum corrected temperature of 2.9 C. Samples were intact and chemically preserved, unless noted below. A SGS North America Inc. Job Number of JD43215 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Compounds qualified as out of range in the continuing calibration summary report are acceptable as per method requirements when there is a high bias but the sample result is non-detect.

MS Volatiles By Method SW846 8260D

Matrix: AQ **Batch ID:** VL10281

- All samples were analyzed within the recommended method holding time.
- Sample(s) JD43215-1MS, JD43215-1MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.

Matrix: AQ **Batch ID:** VL10283

- All samples were analyzed within the recommended method holding time.
- Sample(s) JD43215-21MS, JD43215-21MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- JD43215-21MS/MSD Recovery(s) for Benzene are outside control limits. Outside control limits due to high level in sample relative to spike amount.
- JD43215-23: (pH=6) Sample pH did not satisfy field preservation criteria.
- JD43215-21: Dilution required due to high concentration of target compound.
- JD43215-16: Dilution required due to high concentration of target compound.
- JD43215-15: Dilution required due to high concentration of target compound.
- JD43215-21MS/MSD for 4-Bromofluorobenzene: Outside of in house control limits, but within reasonable method recovery limits.

Matrix: AQ **Batch ID:** VL10284

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD43502-5MS, JD43502-5MSD were used as the QC samples indicated.
- JD43502-5MS/MSD for 4-Bromofluorobenzene: Outside of in house control limits, but within reasonable method recovery limits.

MS Semi-volatiles By Method SW846 8270E

Matrix: AQ **Batch ID:** OP39191A

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- OP39191A-BS1/BSD for 2,4-Dinitrophenol: Outside of in house control limits.
- RPD of OP39191A-BSD for 2,4-Dinitrophenol: Analytical precision exceeds in-house control limits.

Matrix: AQ **Batch ID:** OP39192

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- RPD of OP39192-BSD for Pyridine: Analytical precision exceeds in-house control limits.
- RPD of OP39192-BSD for 2,4-Dinitrophenol: Analytical precision exceeds in-house control limits.
- OP39192-BS1 for Pyridine: Outside of in house control limits.
- JD43215-26 for 4-Nitrophenol: Associated CCV outside of control limits high, sample was ND.
- JD43215-25 for 4-Nitrophenol: Associated CCV outside of control limits high, sample was ND.

MS Semi-volatiles By Method SW846 8270E BY SIM

Matrix: AQ **Batch ID:** OP39191

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.

Matrix: AQ **Batch ID:** OP39192A

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD43215-26 have compounds reported with “E” qualifiers indicating estimated value exceeding calibration range.
- Blank Spike Recovery(s) for Acenaphthene, Acenaphthylene, Anthracene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Benzo(k)fluoranthene, Chrysene, Dibenzo(a,h)anthracene, Fluoranthene, Fluorene, Indeno(1,2,3-cd)pyrene, Naphthalene, Phenanthrene, Pyrene are outside control limits. The spike standard was not added.
- OP39192A-BS12: Spike omitted out. Since balnk spike duplicate recoveries are within control limits, data are qualified and reported.
- OP39192A-BS12 for 2-Fluorobiphenyl: Outside of in house control limits.
- RPD of OP39192A-BSD12 for all compounds: Analytical precision exceeds in-house control limits.
- JD43215-23 for Terphenyl-d14: Outside of in house control limits.

GC Volatiles By Method SW846-8011

Matrix: AQ **Batch ID:** OP39196

- All samples were extracted within the recommended method holding time.
- Sample(s) JD43215-1MS, JD43215-2DUP, JD43215-1MS were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- Matrix Spike Recovery(s) for 1,2-Dibromoethane are outside control limits. Outside control limits due to matrix interference.

Matrix: AQ **Batch ID:** OP39197

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD43215-21MS, JD43215-22DUP were used as the QC samples indicated.
- JD43215-22 for 2-Bromo-1-chloropropane: Outside control limits due to matrix interference.

Metals Analysis By Method SW846 6020B

Matrix: AQ **Batch ID:** MP32378

- All samples were digested within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD43215-14FMS, JD43215-14FMSD, JD43215-14FSDL were used as the QC samples for metals.
- RPD(s) for Serial Dilution for Lead, Vanadium are outside control limits for sample MP32378-SD1. Percent difference acceptable due to low initial sample concentration (< 50 times IDL).

Matrix: AQ **Batch ID:** MP32396

- All samples were digested within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD43215-21FMS, JD43215-21FMSD, JD43215-21FSDL were used as the QC samples for metals.
- RPD(s) for Serial Dilution for Vanadium, Zinc are outside control limits for sample MP32396-SD1. Percent difference acceptable due to low initial sample concentration (< 50 times IDL).

SGS North America Inc. certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

SGS North America Inc. is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by SGS North America Inc indicated via signature on the report cover

4165-60-0	Nitrobenzene-d5	69%		29-124%
321-60-8	2-Fluorobiphenyl	64%		23-122%
1718-51-0	Terphenyl-d14	68%		22-130%

ND = Not detected MDL = Method Detection Limit
RL = Reporting Limit
E = Indicates value exceeds calibration range

J = Indicates an estimated value
B = Indicates analyte found in associated method blank
N = Indicates presumptive evidence of a compound

SGS North America Inc.
